## Program Description

The goal of the program is to provide trainees with a high-quality applications-oriented undergraduate education based on state-of-the-art technological equipment associated with Telecommunication Engineering. This goal is achieved through several objectives such as continuing to update specific courses in the program to ensure relevance to the latest industrial changes, supporting the development of appropriate computer facilities, promoting the integration of advanced technology in all courses, and encouraging professional growth. The program is designed to satisfy the educational needs of the Saudi Council of Engineers by providing a climate that fosters self-awareness, personal growth, and a desire for lifelong learning.

Trainees completing a major in Telecommunication Engineering receive a strong foundation in signals and systems, communication theory, electromagnetics, digital communication, and object oriented programming. Trainees have the opportunity to select additional elective courses in two semesters. Although electromagnetics remain important, one of the newest and fastest growing areas is in the application of computers for simulation and control systems.

The manufacturers of telecommunication need telecom engineers who are familiar with magnates and signal controls, both traditional and computer-controlled. The telecom industry provides and controls the signals, communication, microwave, and wireless equipment required to effectively communicate homes, businesses, and industries. Telecom engineers design digital communication systems and modifications to existing telecom systems that generate and use large amounts of signals required for distribution networks that are economical, safe, and functional.

Graduates of the Telecommunication Engineering major understand, design, analyze, and work effectively in industrial settings utilizing product/process control systems and telecom systems. Graduates are working in telecom companies, telecom manufacturing, signal processing, utilities, telecom equipment, sales, manufacturing and testing, and a host of other diverse industries.

The program curriculum includes magnetics and wireless systems; digital circuits and systems; programmable logic controllers and automated control systems; cellular systems and industry practices; object oriented programming; telecom system and communication theory and Graduation Project. The faculty core courses provide the opportunity to improve writing skills. Mathematics and physics provide the background to help learn the telecom course material.

The bachelor degree program in Telecommunication Engineering allows a plan that will necessarily be highly structured during four semesters.. The program has 77 credit hours divided into obligatory courses and elective courses.

The Theoretical and Practical Tests and Graduation Projects Determine Learning Outcomes and Trainee Levels for each program.

The training courses contain a theoretical part and a practical part. The practical part is tested as a practical test and the theoretical part is a theoretical test with different evaluation methods

The Bachelor Degree Graduate gets the seventh level in the Saudi Arabian Qualifications Framework (SAQF).

**Admission Requirements:** The applicant must have a diploma in Telecommunications.

## Brief Description

<b>Course Name</b>	<b>Engineering project Managements</b>	<b>Course Code</b>	<b>GNRL402</b>	<b>Credit Hours</b>	<b>3</b>
<b>Description</b>	This course is designed to give the trainee a basic knowledge of the role of engineers in management of organizations. Managerial functions related to production, inventory and human resources. Project planning and control. Case studies pertaining to engineering problems..				

<b>Course Name</b>	<b>Engineering Economy</b>	<b>Course Code</b>	<b>GNRL405</b>	<b>Credit Hours</b>	<b>2</b>
<b>Description</b>	This course gives the trainee a basic knowledge about the Fundamentals of engineering economy. Time value of money. Evaluation of alternatives. Replacement and retention analysis. Break even analysis. Depreciation methods. Basics of inflation..				

<b>Course Name</b>	<b>Statistics and Probability</b>	<b>Course Code</b>	<b>STAT 303</b>	<b>Credit Hours</b>	<b>3</b>
<b>Description</b>	The purpose of this course is to give the trainee a basic knowledge of descriptive statistics with graphical summaries. Basic concepts of probability and its engineering applications. Commonly used distributions for discrete and continuous random variables. Confidence intervals. Hypothesis testing. Correlation and simple linear regression.				

<b>Course Name</b>	<b>Structured Computer Programming</b>	<b>Course Code</b>	<b>TCOM 323</b>	<b>Credit Hours</b>	<b>3</b>
<b>Description</b>	<p>This course is designed to give the trainee a basic knowledge on introduction to computers. Simple algorithm and flowcharts. Solving engineering and mathematical problems using a mathematically-oriented programming language. Programming concepts: I/O, assignment, conditional loops, functions and subroutines. Programming selected numerical and non-numerical problems of mathematical and engineering nature</p>				

<b>Course Name</b>	<b>Electrical Systems and Circuits</b>	<b>Course Code</b>	<b>TCOM 435</b>	<b>Credit Hours</b>	<b>3</b>
<b>Description</b>	<p>This course gives the trainee a basic knowledge about the Resonance circuits. Magnetically-coupled circuits. Op-amp circuits. Transient analysis via the conventional and Laplace methods. Fourier analysis with applications to circuits. Two-port networks.</p>				

<b>Course Name</b>	<b>Electronics II</b>	<b>Course Code</b>	<b>TCOM 333</b>	<b>Credit Hours</b>	<b>3</b>
<b>Description</b>	<p>This course is designed to give the trainee a basic knowledge of feedback in amplifiers. Frequency response of amplifier. Operational amplifiers: design and applications as linear and non-linear analog building blocks, adders, subtractors, differentiator, integrators, analog simulation, and active filters. Logarithmic and exponential amplifiers, precision converters, analog multipliers, wave-shapers, sinusoidal and square wave oscillators.</p>				

<b>Course Name</b>	<b>Analytical Methods in Engineering</b>	<b>Course Code</b>	<b>TCOM 334</b>	<b>Credit Hours</b>	<b>3</b>
<b>Description</b>	The purpose of this course is to give the trainee a basic knowledge of continuous time (CT) and discrete time (DT) signals. signal transform and signal processing systems with their properties and practical examples. The contents of this course include signal p=operations, convolution operation, Fourier, Laplace and z-transforms, and the introduction of the MATLAB software with some computer simulation examples.				

<b>Course Name</b>	<b>Communication Theory</b>	<b>Course Code</b>	<b>TCOM 465</b>	<b>Credit Hours</b>	<b>3</b>
<b>Description</b>	This course gives the trainee a deep understanding of Autocorrection function and spectral density. Random signal theory: Continuous and discrete random variables, transformation of random variables, stationary random processes, time average and ergodicity, power spectral density of stationary random processes. Signal-to-noise ratio and probability of error. Noise equivalent bandwidth. Optimum receivers. Pulse detection and matched filters. Signal distortion in transmission and equalization. Noise in linear and exponential modulation. PCM systems: Uniform and no Uniform quantization, noise in PCM, DPCM and DM. Nose in pulse modulation.				

<b>Course Name</b>	<b>Analytical Methods in Engineering</b>	<b>Course Code</b>	<b>TCOM 334</b>	<b>Credit Hours</b>	<b>3</b>
<b>Description</b>	This course is designed to give the trainee a basic knowledge of Linear algebra: metrics and determinants, eigenvalues and eigenvectors. Complex analysis: complex arithmetic, complex algebra, differentiation and integration in the complex plane and residue analysis. Graphs theory.				

<b>Course Name</b>	<b>Electromagnetics</b>	<b>Course Code</b>	<b>TCOM 404</b>	<b>Credit Hours</b>	<b>4</b>
<b>Description</b>	The purpose of this course is to give the trainee a basic knowledge of Electrostatic fields. Poisson and Laplace equations. Steady Electric Current. Steady Magnetic Field. Time-varying electric and magnetic fields. Maxwell equations.				

<b>Course Name</b>	<b>Object-oriented Programming</b>	<b>Course Code</b>	<b>TCOM 424</b>	<b>Credit Hours</b>	<b>3</b>
<b>Description</b>	The purpose of this course is to give the trainee a basic knowledge of Objects-oriented programming: classes, objects and methods. Object-oriented design. Simple data structures. Best programming practices (structured coding. Documentation, testing and debugging).				

<b>Course Name</b>	<b>Digital Communication</b>	<b>Course Code</b>	<b>TCOM 468</b>	<b>Credit Hours</b>	<b>3</b>
<b>Description</b>	This course is concerned with the Sampling theorem, PCM, bandpass digital modulation methods (ASK, FSK and PSK), noise analysis and error probability, digital filters, and digital and discrete-time signal processing, Z transform, digital filter design in frequency domain, digital matched filters, interference and jamming, effects of sampling errors, modern digital modulation methods, chirp modulation, spread spectrum.				

<b>Course Name</b>	<b>Graduation Project</b>	<b>Course Code</b>	<b>TCOM 490</b>	<b>Credit Hours</b>	<b>4</b>
<b>Description</b>	The course presents major topics in Selection of topics: literature review; project design planning, arranging data collection, and experimental work. Experimental work and data collection or field study. Data processing analysis and results. Preparation of the first draft of final report. Presentation of the project.				

<b>Course Name</b>	<b>Principles of Automatic Control</b>	<b>Course Code</b>	<b>TCOM 412</b>	<b>Credit Hours</b>	<b>3</b>
<b>Description</b>	The course includes introduction to control systems with examples from fields. Transfer functions and block diagram algebra. Stability analysis (Routh-Hurwitz and Nyquist). Design of Control Systems using Bode diagrams and root locus technique.				

<b>Course Name</b>	<b>Information Theory and Coding</b>	<b>Course Code</b>	<b>TCOM 466</b>	<b>Credit Hours</b>	<b>3</b>
<b>Description</b>	The purpose of the project is to make the final year trainee acquainted with Information theory is concerned with the fundamental limits of communication. What is the ultimate limit to data compression? e.g. how many bits are required to represent a music source. What is the ultimate limit of reliable communication over a noisy channel, e.g. how many bits can be sent in one second over a line..				

<b>Course Name</b>	<b>Antenna Theory</b>	<b>Course Code</b>	<b>TCOM 443</b>	<b>Credit Hours</b>	<b>3</b>
<b>Description</b>	This course is designed to give the trainee a basic knowledge of Radiation and Antenna Fundamentals. Linear Antennas, Current distribution, Short dipoles And Monopoles/2 dipoles, radiation resistance and gain, longer dipoles, folded dipoles. Antenna Arrays. Aperture Antennas. Special types of antennas. Traveling wave antennas, loop antennas. Frequency independent antennas, helical Antennas, corner reflector, lenses. Space Wave Propagation. Ground Wave Propagation. Tropospheric waves. Ionospheric waves.				

<b>Course Name</b>	<b>Digital Signal Processing</b>	<b>Course Code</b>	<b>TCOM 473</b>	<b>Credit Hours</b>	<b>3</b>
<b>Description</b>	This course aims to make the trainee aware of the basic principles of Discrete time signals and systems, Fourier analysis of discrete-time and systems-Fast Fourier transform-Digital Filter Design-Computer Applications-Advanced Topics.				

<b>Course Name</b>	<b>Digital Design</b>	<b>Course Code</b>	<b>TCOM 474</b>	<b>Credit Hours</b>	<b>3</b>
<b>Description</b>	The purpose of this course is to give the trainee a basic knowledge of Analysis and synthesis of gate networks. Elements of minimization techniques. Synthesis using NAND and NOR gates. Analysis of sequential networks. Synthesis of pulse-mode and fundamental mode sequential networks. Flow tables and State diagrams. Hazards. Use of MSI and LSI in the implementation of combinational and sequential circuits.				

<b>Course Name</b>	<b>Wireless Communication Systems</b>	<b>Course Code</b>	<b>TCOM 469</b>	<b>Credit Hours</b>	<b>3</b>
<b>Description</b>	This course introduces fundamental technologies for wireless communications. It addresses the following topics: review of modulation techniques, wireless channel modeling, multiple access schemes, cellular communications, diversity techniques, equalization, channel coding, selected advanced topics such as OFDM, cognitive radio, cooperative communications, space time coding, and smart antenna systems				

<b>Course Name</b>	<b>Advanced Communication Systems</b>	<b>Course Code</b>	<b>TCOM 442</b>	<b>Credit Hours</b>	<b>3</b>
<b>Description</b>	The purpose of this course is to enable the trainee to be familiar with the Detailed description of at least three out of the following systems. Radio broadcasting Systems. TV and Video Systems. Radar Systems. Microwave Links, Telephony, Telegraphy and Telex systems. Satellite Communication Systems. Optical Communication Systems. Aircraft and Ship navigational systems				

<b>Course Name</b>	<b>Special Topics in communication</b>	<b>Course Code</b>	<b>TCOM 467</b>	<b>Credit Hours</b>	<b>3</b>
<b>Description</b>	The purpose of this course is to give the trainee a basic knowledge of Selected topic to develop the skills and knowledge in a given field after the official approval from the faculty.				

## Study Plan

Sixth Semester								
No.	Course Code	Course Name	Pre. Req	No. of Units				
				CRH	L	P	T	CTH

<p><b>Course description :</b>                      This course gives the trainee a deep understanding of Autocorrection function and spectral density. Random signal theory: Continuous and discrete random variables, transformation of random variables, stationary random processes, time average and ergodicity, power spectral density of stationary random processes. Signal-to-noise ratio and probability of error. Noise equivalent bandwidth. Optimum receivers. Pulse detection and matched filters. Signal distortion in transmission and equalization. Noise in linear and exponential modulation. PCM systems: Uniform and no Uniform quantization, noise in PCM, DPCM and DM. Noise in pulse modulation.</p> <p><b>Topics :</b>                      This includes the following:</p> <ul style="list-style-type: none"> <li>• Review of Fourier Analysis and Linear System Theory.</li> <li>• Correlation and Spectral Density.</li> <li>• Sampling and Pulse Modulation.</li> <li>• Review of Probability and Random Variables.</li> <li>• Random Signals and Noise.</li> <li>• Noise in Analog Modulation</li> <li>• Baseband Digital Transmission</li> <li>• Digitization Techniques for Analog Messages and Networks</li> </ul> <p><b>Experiments:</b> If applicable, it will support the course topics.</p> <p><b>References :</b></p> <ul style="list-style-type: none"> <li>• A. **Course description :**

The course includes four main topics in the field of automatic control: Introduction to control systems with examples from fields. Transfer functions and block diagram algebra. Stability analysis (Routh-Hurwitz and Nyquist). Design of Control Systems using Bode diagrams and root locus technique.

**Topics :**

- Control System Terminology.
- Linear Systems and Differential Equations.
- Frequency Response.
- Stability.

**Experiments:** if applicable it will support the course topics.

**References :**

- M. Ogata " Modern Control Engineering " Last edition Prentice Hall
- B C Nakra Theory and Applications of Automatic Controls
- Robert E. King Computational Intelligence in Control Engineering
- Pao C. Chau Process Control: A First Course with MATLAB

<b>Details of Theoretical Contents</b>		<b>Hours</b>
<b>No.</b>	<b>Contents</b>	
1.	<b>Control System Terminology:</b>  Block diagram fundamentals, Transfer functions, Closed-loop control, Open-loop control (Feedback systems), Block-diagram algebra, Servomechanisms, Regulators.	6
2.	<b>Linear Systems and Differential Equations:</b>  Equation of physical systems, Ordinary differential equations, Linearity, Superposition, Causality, Solution of linear constant coefficient ordinary differential equations (1st order and 2nd order),	8
3.	<b>Frequency Response:</b>  The Laplace transform and its inverse, Properties of Laplace transform, Application of Laplace transform to the solution of linear constant coefficient ordinary differential equations, Frequency response function, Bode magnitude and phase plots, Straight line approximation, Plant identification.	8
4.	<b>Stability:</b>  Definitions of stability, The root locus method, The Hurwitz-Routh stability criterion, The Nyquist criterion, Performance and Robustness, The design of control system (proportional control, lag-compensator, lead-compensator).	10
<b>Textbook:</b>	<ul style="list-style-type: none"> <li>• M. Ogata " Modern Control Engineering " Last edition Prentice Hall</li> <li>• B C Nakra Theory and Applications of Automatic Controls</li> </ul>

CRH: Credit Hours    L: Lecture    P: Practical    T: Tutorial    CTH: Contact Hours					
<b>Course description :</b>					
<p>The purpose of this course is to give the student a basic knowledge of Radiation and Antenna Fundamentals. Linear Antennas, Current distribution, Short dipoles And Monopoles/2 dipoles, radiation resistance and gain, longer dipoles, folded dipoles. Antenna Arrays. Aperture Antennas. Special types of antennas. Traveling wave antennas, loop antennas. Frequency independent antennas, helical Antennas, corner reflector, lenses. Space Wave Propagation. Ground Wave Propagation. Tropospheric waves. Ionospheric waves</p>					
<b>Topics :</b>					
The course contains four main topics:					
<ul style="list-style-type: none"> <li>• The Hertzian Dipole</li> <li>• Antenna Radiation Characteristics</li> <li>• Half-Wave Dipole Antenna</li> <li>• Aperture Antennas</li> <li>• Antenna Arrays.</li> </ul>					
<b>Experiments:</b> If applicable, it will support the course topics.					
<b>References :</b>					
<ul style="list-style-type: none"> <li>• : F. Ulaby, Fundamentals of Applied Electromagnetics, 6th Media Edition, Prentice-Hall, 2010.</li> </ul>					

Details of Theoretical Contents		Hours
No	Contents	Hours
1.	<b>The Hertzian dipole</b> Far-Field Approximation, Power Density	8
2.	<b>Antennas radiation characteristics</b> Antenna Pattern, Beam Dimensions, Antenna Directivity, Antenna Gain, Radiation Resistance	8
3.	<b>Dipole antenna</b> Directivity of $\lambda/2$ Dipole, Radiation Resistance of $\lambda/2$ Dipole, Quarter-Wave Monopole Antenna, Dipole of arbitrary length	12
4.	<b>Area of receiving antenna</b> Effective area of receiving antenna, Friis transmission formula	12
5.	<b>Aperture antennas</b> Radiation by Large- Aperture antennas, Rectangular aperture with uniform aperture distribution	12
6.	<b>Antenna arrays</b> Antenna arrays presentation, N-element array with uniform phase distribution Electronic scanning of arrays, Electronic Scanning of Arrays	12
<b>Textbook:</b>	<ul style="list-style-type: none"> <li>• F. Ulaby, Fundamentals of Applied Electromagnetics, 6th Media Edition, Prentice-Hall, 2010</li> </ul>

**Course description :**

This course gives the student a basic knowledge about the Detailed description of at least three out of the following systems. Radio broadcasting Systems. TV and Video Systems. Radar Systems. Microwave Links, Telephony, Telegraphy and Telex systems. Satellite Communication Systems. Optical Communication Systems. Aircraft and Ship navigational systems.

**Topics :**

- Link Budget Analysis
- Digital Modulation
- Optical Communications
- Satellite Communications
- Mobile Communications
- 

**Experiments:** If applicable, it will support the course topics.

**References :**

1. "Wireless Communications, principles and practice", 2nd ed by Theodore S. Rappaport, Prentice-Hall, 2002.
2. "Satellite Communications", by Dennis Roddy, McGraw-Hill, Chapter 16, 2001.

<b>Details of Theoretical Contents</b>		
<b>No</b>	<b>Contents</b>	<b>Hours</b>
1.	<b>Introduction, Noise in Communication Systems</b> Degradation of Link Quality, Internal and extern Noise, Signal Noise Ration, Noise Figure, Input Referred Noise (I), Minimum Signal (cont)	4
2.	<b>Link Budget Analysis</b> Context, Types of link, Free space loss, Power in a wireless system, Link budget, Example link budget calculation, Fresnel zone , Equation of Noise	4
3.	<b>Digital Modulation</b> Factors that influence the choice of Digital Modulation, BW and power Spectral density of digital signals, Linear Modulation Techniques, Constant Envelope Modulation, combine Linear and Constant Envelope Modulation Techniques, Modulation Performance in Fadding and multipath Channels	10
4.	<b>Optical Communications</b> Evolution of Lightwave Systems, Components Lightwave Systems, Optical signal generation, Signal Propagation in Fibers, Signal recovery and Noise, Optical Amplifier Noise, Presentation of Optical Network	10
5.	<b>Satellite Communications</b> Overview and historical perspective of the GSO, Communication Satellite Sharing of the GSO, Factors Affecting Orbit-Spectrum Utilization (homogenous case)	10
6.	<b>Mobile Communications</b> Introductory Concepts, Modern Wireless Communication Systems (first , second and 3rd generation), The Cellular Engineering Fundamentals (Channel Assignment Strategies, Handoff Process, Interference & System Capacity,	10

	Enhancing Capacity And Cell Coverage, Trunked Radio System) , Free Space Radio Wave Propagation (Outdoor Propagation Models, Indoor Propagation Models) , Multipath Wave Propagation and fading

**Course Objectives:**

The purpose of this course is to make the final year student aquatinted with the ways and means, which are adopted to carry out an investigation to solve one of the technical problems. Also, to make the student able to present and prepare a detailed report.

**Topics :**

Each student must undertake a project in one of the main topics listed there under. The relevant projects are offered as\_options. Details of the projects available will be handed out to the students at the last semester. Some of these projects will involve the use of laboratory or computer or both. It is recommended that the student should choose the project option that most relevant to the courses he undertakes. It is also expected that he will carry out a literature survey on the topic of this project. The main topics are given below as:

1. Electromagnetics
2. Cellular Mobile Communication
3. Wireless Communication
4. Digital Communication
5. Signal Processing
6. Error Detection in Wireless Communication
7. Any other Related topics approved by the Departement .

<b>Course Description:</b> This course aims to make the trainee aware of the basic principles of static and time varying electric and magnetic fields. The course supplies the trainee with sufficient methods and rules for calculating the intensity of electric and magnetic fields as well as potential for conventional models.						
<b>Topics:</b> <ul style="list-style-type: none"> <li>• Theory of the Electromagnetic Field</li> <li>• Quantities of the Electromagnetic Field</li> <li>• The Laws of the Electromagnetic Field</li> <li>• The Energy of the Electromagnetic Field</li> </ul>						
<b>Experiments:</b> If applicable, it will support the course topics.						
<b>References:</b> Andrei Nicolaide, "General Theory of the Electromagnetic Field", Transilvania University Press, Braşov, 2012.						

<b>Detailed of Theoretical Contents</b>		
<b>No.</b>	<b>Contents</b>	<b>Hours</b>
1.	<b>Theory of the Electromagnetic Field</b> Field and Substance, Lines of Field, Physical Quantities, Manners of Studying the Theory of the Electromagnetic Field, General Considerations on the Structure of Conductors and Dielectrics, Electric Field Strength and The Electric Current.	<b>12</b>
2.	<b>Quantities of the Electromagnetic Field</b> The Expressions of the Force and Electric Field Strength and Electromagnetic Potentials.	<b>16</b>
3.	<b>The Laws of the Electromagnetic Field</b> The Law of Electric Flux, The Relation between the Electric Displacement, Electric Field Strength and Electric Polarization, The Law of Magnetic Flux, The Law of Electromagnetic Induction for Media at Rest, The Law of Magnetic Circuit and Derivation of the Fundamental Equations of the Electromagnetic Field Theory in the General Case. Maxwell Equations.	<b>20</b>
4.	<b>The Energy of the Electromagnetic Field</b> The Expression of the Energy of the Electromagnetic Field Poynting Vector, Theorem of Irreversible Transformation of Electromagnetic and The Theorem of Electromagnetic Momentum.	<b>16</b>

**Course Description:**

This course provides the trainee the most extensive coverage of Analysis and synthesis of gate networks. Elements of minimization techniques. Synthesis using NAND and NOR gates. Analysis of sequential networks. Synthesis of pulse-mode and fundamental mode sequential networks. Flow tables and State diagrams. Hazards. Use of MSI and LSI in the implementation of combinational and sequential circuits.

**Topics :**

- Review of flip-flops
- Design of sequential networks using state tables, state graphs, and K-maps for various examples
- Design of iterative networks using state tables, state graphs, and K-maps for various examples
- State reduction and assignment methods
- Design of code converters and pattern detectors
- Design of Arithmetic circuits
- Study of VHDL and its use in di

**Experiments:** If applicable, it will support the course topics.
