## Program Description

Construction program is designed to ensure a high quality knowledge and training for bachelor students and to develop several skills required to meet the needs of the local labor market. This program trends to qualify technical engineers capable to operate and supervise different civil projects, to draft technical reports, to analyze and interpret data and to communicate effectively within multidisciplinary team the engineering problems.

Six semesters of training include mainly English communication, mathematics and professional ethics, communication tools and soft skills, project management in building, quality management and leadership. It also emphasizes knowledge of specialized courses in civil engineering. These courses are architectural and structural drawings, Building materials, structural analysis, reinforced concrete design, geotechnical engineering, hydraulics, highway engineering, surveying, mechanical - electrical engineering in buildings and structural faults and repair.

Graduation project take in consideration a practical idea which be concretized in reality. This project must include prerequisites of all software's used in architectural and civil engineering to simulate the mechanical behaviour. For instance, the elaboration of prototype or working in existing project in collaboration with industry should be considered as the main output of the project. It will be supervised by qualified instructors. The outcomes of this project must be a report (technical or academic) including the experiment labs and the results of the model developed.

The Theoretical and Practical Tests and Graduation Projects Determine Learning Outcomes and Trainee Levels for each program.

The training courses contain a theoretical part and a practical part. The practical part is tested as a practical test and the theoretical part is a theoretical test with different evaluation methods

The Bachelor Degree Graduate gets the seventh level in the Saudi Arabian Qualifications Framework (SAQF).

**Admission Requirements:** The applicant must have a diploma in Civilization Construction and Architectural construction.

## Brief Description

Course Name	1- Building Materials	Course Code	CONS 312	Credit Hours	4
<b>Description</b>	<p>Building materials course concerns the identification of different materials used in building sector like sand, aggregates, cement, stones, steel, etc. It concerns also the elaboration of mixture design between materials such cement paste, mortar and concrete in order to evaluate their physical and mechanical properties. The question is the following: Why the student should study building materials and their properties in civil Engineering in order to be able to:</p> <ul style="list-style-type: none"> <li>• Select a material for a given use based on considerations of cost and performance</li> <li>• Understand the limits of materials and the change of their properties with use</li> <li>• Create a new material that will have some desirable properties.</li> </ul> <p>In second part, the student must understand concrete for using it in professional practice. The internal and external conditions for samples' preparation must be taking in consideration to ensure a sustainable concrete in structures. Moreover, this course discusses two of the most methods of concrete mix design, one American, the other is a British method.</p>				

Course Name	2- Architectural Drawing	Course Code	CONS 321	Credit Hours	3
<b>Description</b>	<p>This course aims to expand trainees' knowledge in construction drawings, to read and interpret architectural drawings by using Autodesk Revit. However, it will allow students to communicate ideas and designs faster, easier, and more beautifully. Besides that, the course develops the ability to visualize and communicate three-dimensional shapes. It is a single software application that supports a BIM workflow from concept to construction. Use Revit to model designs with precision, optimize performance, and collaborate more effectively.</p>				

Course Name	3- Structural Analysis	Course Code	CONS 334	Credit Hours	4
<b>Description</b>	<p>This course deals to classify structural systems, structural design process, computation of loads on structures, analysis of statically determinate and indeterminate structures by different methods and the influence lines for moving loads. Computer applications in structural analysis used two complementary software's such as ROBOT structural analysis and REVIT structural analysis for simulation purpose.</p>				

Course Name	4- Advanced Surveying	Course Code	CONS 341	Credit Hours	4
Description	<p>Surveying course contains the following parts:</p> <ul style="list-style-type: none"> <li>• <b>Introductory Land Surveying Course:</b> This course is generally taken at the beginning of a student's program. Students learn the definition of land surveying. They may also study the different types of tools and techniques used in this line of work. Instructors may schedule online chats where students can discuss the different careers open to graduates.</li> <li>• <b>Surveying Technical Writing Course:</b> Taken at any point in a land surveying program, students learn how to write technical specifications. Instructors provide online lectures about different types of contracts and the appropriate information to include. Students may be assessed by turning in practice specification reports through their class's website or via e-mail.</li> <li>• <b>Land Surveying Legal Regulations Course:</b> Students are provided with an overview of the legal aspects of land surveying. Instructors may schedule online chats to discuss relevant topics, such as property laws, boundary laws and professional ethics. This course is generally taken in the middle of a student's land surveying program.</li> <li>• <b>Advanced Land Surveying Course:</b> Students may take this course towards the end of a program after they have successfully completed an introductory level courses. Instructors provide online lectures on advanced surveying topics, such as geodesy, latitude and longitude and error theory.</li> <li>• <b>Engineering Problem Solving with Spreadsheets:</b> Students study the use of computer spreadsheet programs to solve engineering problems. The course teaches the use of spreadsheet features such as functions and graphing as they applies to survey work.</li> </ul>				

Course Name	5- Structural Drawing	Course Code	CONS 381	Credit Hours	4
Description	<p>This course aims to expand trainees' knowledge in construction drawings, to read and interpret structural drawings of the major civil, mechanical and electrical engineering by using Autodesk Revit. However, it will allow students to communicate ideas and designs faster, easier, and more beautifully. Besides that, the course develops the ability to visualize and communicate three-dimensional shapes. It is a single software application that supports a BIM workflow from concept to construction. Use Revit to model designs with precision, optimize performance, and collaborate more effectively. The objective of this course is to apply current code requirements for structural analysis and design of reinforced concrete through using ROBOT software. It concerns structural loads and load combinations, steel, concrete, materials including codes support especially, direct Analysis Method (DAM), advanced auto-meshing and structural modelling.</p>				

Course Name	6- Design of Concrete Structures	Course Code	CONS 476	Credit Hours	5
Description	This course conduct to analyse and design reinforced concrete structures like continuous beams; continuous one-way, two-way and Flat slabs. Analysing and design of stair slabs, Column under eccentrically loads, and R.C. frames, too. Applying the principles, procedures and basic theory of pre-stressed concrete in structural design.				

Course Name	7- Hydraulics	Course Code	CONS 374	Credit Hours	4
Description	The field of study covers subjects such as drainage basin management, water quality, water conservation and water treatment. Meteorology; precipitation; stream flow, evaporation, and transpiration; subsurface flows, well hydraulics; runoff relations and hydrographs; Water management also includes treatment of drinking water, industrial water, sewage and wastewater, flood protection and the water table. The field of this study covers also subjects such as Fluid properties; hydrostatics; kinematics and dynamics of fluid flows; conservation of mass, energy, and momentum; flows in pipes and open channels. Surface and groundwater, quality control, water distribution systems, storm water collection systems, wastewater systems and sewerage, pumps and pumping stations.				

Course Name	8- Highway engineering	Course Code	CONS 464	Credit Hours	4
Description	The course is concerned with the fundamentals of highway and pavement engineering. It introduces the design process of roads and intersections, including horizontal and vertical alignment design, cross-sections and earthworks. The second half of this strand deals with pavement design and evaluation. Topics include pavement composition, pavement materials, asphalt mix design, the pavement thickness design and, defects in Flexible pavements and, failures in rigid pavements.				

Course Name	9- Structural faults and repair	Course Code	CONS 473	Credit Hours	4
Description	This course focuses in structural faults and repairs mainly in maintenance and repair strategies, serviceability and durability of concrete, materials for repair, techniques for repair and demolition, rehabilitation and retrofitting of structures.				

Course Name	10- Graduation Project	Course Code	CONS 491	Credit Hours	4
Description	Graduation project take in consideration a practical idea which be concretized in reality. This project must include prerequisites of all software's used in architectural and civil engineering to simulate the mechanical behaviour of such structure. For instance, the elaboration of prototype or working in existing project in collaboration with industry should be considered as the main output of the project. Furthermore, the outcomes of this project must be a report (technical or academic) including the experiment labs and the results of the developed model.				

Course Name	11- Mechanical, plumbing and Electrical Engineering for building	Course Code	CONS 475	Credit Hours	3
Description	This course is an overview of the mechanical and electrical systems for building, methods mainly design and implementation. These systems implemented for building such as HAVC, Firefighting, Fire alarm, Elevators, Electrical power systems, lighting, telephone and data systems ensure the quality of living and working. Computer applications should be used to simulate realty via software like AUTOCAD and REVIT.				

Course Name	12- Building Information Modelling	Course Code	CONS 465	Credit Hours	3
Description	BIM (Building Information Modelling) can deliver business benefits whether the designing of sustainable houses or reimagining the infrastructure of entire cities. This management concept is based on REVIT software and enables almost anytime, anywhere access to project data throughout the building construction lifecycle. BIM concept empowers those in the field to better anticipate and act, and those in the back office to optimize and manage all aspects of construction performance. This course concerns also the preparation of the site, earth works, formwork, scaffolding, different structural elements of the construction, precast concrete, masonry works, floors and roofs, internal and external finishes, insulation and protection, shell structures using the BIM concept.				

Course Name	13- Computer application in construction management	Course Code	CONS 463	Credit Hours	3
Description	This course focus to train students on software, like Naviswork, as a comprehensive project review solution that supports coordination, analysis, and communication of design intent and constructability taking in architectural and structural drawing that using Revit. Multidisciplinary design data created in a broad range of Building Information Modelling (BIM), digital prototype, and process plant design applications can be combined into a single integrated project model. Interference management tools help design and construction professionals anticipate and avoid potential problems before construction begins, minimizing expensive delays and rework. Manage the model coordination with project quantities and schedule to deliver simulation and analysis of time and cost.				

Course Name	14- Foundation Analysis and Design	Course Code	CONS 372	Credit Hours	4
Description	This course deals with soil as an engineering material. It includes the description of soil, the analysis of stress in soil, and soil behaviour under conditions of major engineering significance that include the characteristics of water flow through soil, consolidation settlement and shear strength. It also covers the foundation calculation and settlement in soil (Shallow and deep) and in rock from the lab and field tests.				

Course Name	15- Soil Mechanics	Course Code	CONS 311	Credit Hours	4
Description	This course aims to expand the knowledge of engineers in geotechnics, to analyse and interpret soil classification from ASTM and AASTHO standards, Besides that, the course develops analytical skills in dealing with physical properties of soils and the real effect on their behaviour. It also covers the statics of soil, soil structure and compaction of soils using proctor and CBR tests.				

Course Name	16- Hydrology and water management	Course Code	CONS 373	Credit Hours	2
Description	The field of study covers subjects such as hydrogeology, marine hydrology, drainage basin management, water quality, irrigation, water conservation and water treatment. Meteorology; precipitation; stream flow, evaporation, and transpiration; subsurface flows, well hydraulics; runoff relations and hydrographs; elements of stream flow routing, frequency and duration studies; extreme values statistics applied to flood and drought forecasting; application of hydrologic techniques. Water management also includes treatment of drinking water, industrial water, sewage and wastewater, flood protection and the water table. Opportunities after graduation cover jobs as a group manager in a private company, university lecturer, scientists in hydrology or water resources consultant. Meteorology; precipitation; stream flow, evaporation, and transpiration; subsurface flows, well hydraulics; runoff relations and hydrographs; elements of stream flow routing, frequency and duration studies; extreme values statistics applied to flood and drought forecasting; application of hydrologic techniques.				

Course Name	17- Building sustainability	Course Code	CONS 486	Credit Hours	2
Description	A sustainable building, or green building is an outcome of a design philosophy which focuses on increasing the efficiency of resource use — energy, water, and materials — while reducing building impacts on human health and the environment during the building's lifecycle, through better siting, design, construction, operation, maintenance, and removal.[1] Though green building is interpreted in many different ways, a common view is that they should be designed and operated to reduce the overall impact of the built environment on human health and the natural environment by (a) Efficiently using energy, water, and other resources, (b) Protecting occupant health and improving employee productivity, and (c) Reducing waste, pollution and environmental degradation.				

Course Name	18- Design of special concrete	Course Code	CONS 433	Credit Hours	2
Description	This course aims to design pre-stressed concrete sections. It will include basic concept of pre-stressing, pre-stressing technology, steel and concrete materials, computation of fibre stresses, pre-stress losses, flexural and shear behavior at service loads and ultimate loads, deflection and crack control, load balancing, anchorage zone, design and construction integration, and use STRUCTURAL BRIDGE DESIGN software to analyse and design pre-stressed concrete bridge.				

<b>Course Name</b>	<b>19- Design of Steel Structures</b>	<b>Course Code</b>	<b>CONS 431</b>	<b>Credit Hours</b>	<b>3</b>
<b>Description</b>	In this course, trainees get to know how to analyze and design tension and compression steel members, Columns under eccentric loadings, Column bases and footings, Beams for Flexure and Shear, bolted and welded Connections, Structural Steel design Project. Using software through Trusses 2D, 3D module and Frame 2D, 3D module is essential for steel design.				
<b>Course Name</b>	<b>20- OHSAS/Neibosh/NFPA safety building</b>	<b>Course Code</b>	<b>CONS 404</b>	<b>Credit Hours</b>	<b>2</b>
<b>Description</b>	The design and construction of secure and safe buildings (minimal danger or risk of harm) continues to be the primary goal for owners, architects, engineers, project managers, and other stakeholders. The building and construction industry is marked by a high rate of attrition and many serious work accidents. Occupational fatalities are individuals who die while on the job or performing work related tasks. Within the field of construction, it is important to have safe construction sites.				
<b>Course Name</b>	<b>21- Advanced Concrete Technologies</b>	<b>Course Code</b>	<b>CONS 435</b>	<b>Credit Hours</b>	<b>3</b>
<b>Description</b>	Advance Concrete is a computer-aided design (CAD) used for modeling and detailing reinforced concrete structures. Advance Concrete is used in the structural / civil engineering and drafting fields. The correlation between different methods of formulation and with software is essential to more understand the huge topic of concrete design.				
<b>Course Name</b>	<b>22- Utilizing Solid wastes in construction</b>	<b>Course Code</b>	<b>CONS 405</b>	<b>Credit Hours</b>	<b>3</b>
<b>Description</b>	The main objective of this course is to investigate the potential use of various solid wastes for producing construction materials. The traditional methods for producing construction materials are using the valuable natural resources. The industrial and urban management systems are generating solid wastes, and most often dumping them in open fields. These activities pose serious detrimental effects on the environment. To safeguard the environment, many efforts are being made for the recycling of different types of solid wastes with a view to utilizing them in the production of various construction materials.				

## Core Courses Description

<b>Department</b>	<b>Civil And Architectural Engineering</b>	<b>Major</b>	Applied Civil Engineering

<p><b>Course description:</b> This course aims to expand trainees' knowledge in construction drawings, to read and interpret structural drawings of the major civil, mechanical and electrical engineering by using Autodesk Revit. However, it will allow students to communicate ideas and designs faster, easier, and more beautifully. Besides that, the course develops the ability to visualize and communicate three-dimensional shapes. It is a single software application that supports a BIM workflow from concept to construction. Use Revit to model designs with precision, optimize performance, and collaborate more effectively. The objective of this course is to apply current code requirements for structural analysis and design of reinforced concrete through using ROBOT software. It concerns structural loads and load combinations, steel, concrete, materials including codes support especially, direct Analysis Method (DAM), advanced auto-meshing and structural modelling.</p> <p><b>Topics:</b></p> <ul style="list-style-type: none"> <li>• Introduction to REVIT software</li> <li>• Type of construction drawings</li> <li>• Construction details</li> </ul> <p><b>Experiments:</b> If applicable, it will support the course topics.</p> <p><b>References:</b></p> <ul style="list-style-type: none"> <li>• Essentials Revit Architecture.</li> <li>• Blueprint Reading, Author: Sam Kubba.</li> <li>• Blue Print Reading: Interpreting Working Drawings, Author: E. <b>Course description :</b> This course aims to expand the knowledge of engineers in geotechnics, to analyse and interpret soil classification from ASTM and AASTHO standards, Besides that, the course develops analytical skills in dealing with physical properties of soils and the real effect on their behaviour. It also covers the statics of soil, soil structure and compaction of soils using proctor and CBR tests.								
<b>Topics :</b> <ul style="list-style-type: none"> <li>• Soil identification</li> <li>• Physical properties of soil</li> <li>• Soil permeability</li> <li>• Soil structure</li> <li>• Statics of soil</li> <li>• Soil compaction</li> </ul>								
<b>Experiments:</b> if applicable it will support the course topics.								
<b>References :</b> <ul style="list-style-type: none"> <li>- An Introduction to the Mechanics of Soils and Foundations, Atkinsom, J., McGraw-Hill Inc, 1993.</li> </ul>								

	<b>Theoretical Content</b>	<b>Hours</b>
1	- <b>Soil identification</b> by grain size distribution (sieve and hydrometer analysis) - <b>Soil classification</b> according to ASTM and AASHTO standards	3
2	- <b>Soil consistency</b> States of soil Soil classification from Atterberg Chart	3
3	- <b>Physical properties of soil</b> Dry and bulk densities Void ratio, porosity and permeability Relative density, saturation degree	3
4	- <b>Soil permeability</b> Darcy law Velocity and quantity of water flow Intrinsic permeability	3
5	- <b>Statics of soil</b> Stress tensor in soil Deformation ellipsoid Mohr circle	3
6	- <b>Soil structure</b> Cohesive soils Non-cohesive soils Determination of cohesion and friction angle	5
7	- <b>Compaction of soil</b> Proctor test (Standard and modified)	6

	Capacity bearing calculation from California Bearing Ratio, CBR Field tests for soil compaction

**Course description :**

The field of study covers subjects such as hydrogeology, marine hydrology, drainage basin management, water quality, irrigation, water conservation and water treatment. Meteorology; precipitation; stream flow, evaporation, and transpiration; subsurface flows, well hydraulics; runoff relations and hydrographs; elements of stream flow routing, frequency and duration studies; extreme values statistics applied to flood and drought forecasting; application of hydrologic techniques. Water management also includes treatment of drinking water, industrial water, sewage and wastewater, flood protection and the water table. Opportunities after graduation cover jobs as a group manager in a private company, university lecturer, scientists in hydrology or water resources consultant.

Meteorology; precipitation; stream flow, evaporation, and transpiration; subsurface flows, well hydraulics; runoff relations and hydrographs; elements of stream flow routing, frequency and duration studies; extreme values statistics applied to flood and drought forecasting; application of hydrologic techniques.

**Topics :**

- Coastal Engineering
- Subsurface Hydrology
- Sediment Transport Engineering
- Computational River Hydraulics
- Transport Processes in Surface Waters
- Computational Watershed Hydrology
- Water Resources Systems Engineering
- Environmental Fluid Mechanics
- Statistical Hydrology
- Advanced Hydrology
- Advanced Problems in Hydromechanics and Hydraulic Engineering

**Experiments:** if applicable it will support the course topics.

**References :**

Lin, Shun D. and Lee, C. C. (2001) "Water and wastewater calculation manual", McGraw-Hill Professional.

Detailed of Theoretical Content		
	Contents	Hours
1	<b>Coastal Engineering</b> An introduction to coastal engineering with emphasis on the interaction between oceanic dynamic processes (waves, currents, and tides) and coastal regions (beaches, harbors, structures, and estuaries) and on the engineering approaches necessary to prevent adverse effects caused by this interaction.	2

<b>2</b>	<p><b>Subsurface Hydrology</b>                  Basic principles of fluid flow in saturated and unsaturated materials. Darcy's law, well hydraulics, determination of hydraulic properties of aquifers. Infiltration theory. Discussions of artificial recharge, land subsidence, saltwater intrusion, ground water quality and contamination.</p>	<b>2</b>
<b>3</b>	<p><b>Sediment Transport Engineering</b>                  Sediment properties and the mechanics of sediment transport. Threshold of movement. Riverbed load and suspended load theories. Regime theory and stable channel design. River diversion problems. Erosion. Geomorphologic and water quality aspects.</p>	<b>2</b>
<b>4</b>	<p><b>Computational River Hydraulics</b>                  Use of professional computer programs for the solution of river hydraulics problems. General formulation of energy losses in a river reach. Methods of handling the presence of bridges; software for handling bridges only. Channel modifications. Floodway determination. Flow around islands. River networks analysis.</p>	<b>2</b>
<b>5</b>	<p><b>Transport Processes in Surface Waters</b>                  Four main topics are covered: (1) density-stratified two-layer systems in lakes and channels, with applications to mixed-layer growth, oil-spill containment, salinity intrusions, (2) advection-diffusion modeling in channels, including analytical and numerical solutions to steady and unsteady, one- and two-dimensional problems, (3) mechanisms of diffusional transport, including turbulence in channels and longitudinal shear dispersion, and (4) near-field analysis of discharges, including similarity analyses of jets and plumes.</p>	<b>2</b>
<b>6</b>	<p><b>Computational Watershed Hydrology</b>                  Use of professional computer programs for the calculation of the runoff from complex basins. Generation of unit hydrographs. Calculation of losses, channel and reservoir routing, parameter optimization, and application of Kinematic wave technique to urban catchments.</p>	<b>2</b>
<b>7</b>	<p><b>Water Resources Systems Engineering</b>                  Systems analysis, modeling, and optimization in water quantity and water quality management; linear, nonlinear, and dynamic programming models; stochastic models; risk analysis; simulation. Application to engineering problems found in the areas of water supply, water quality and process control, residuals, urban drainage, and river basin development and management.</p>	<b>3</b>
<b>8</b>	<p><b>Environmental Fluid Mechanics</b>                  Advanced fluid mechanics associated with environmental flows, with variable focus. Possible focus includes density-stratified flows (internal waves, plumes, estuarine circulation); rotational flows (geostrophic flows, Kelvin waves, Eckman layers); turbulence and mixing in the environment; dynamics of lakes.</p>	<b>2</b>
<b>9</b>	<p><b>Statistical Hydrology</b>                  Probability distributions applicable to hydrologic events; analysis of extremes, floods and droughts; statistical association between hydrologic variables. Analysis of hydrologic time series. Spectral and parametric formulation of stochastic models of rainfall, runoff, rainfall-runoff transfer, and other hydrologic variables. Application of Markov chains and point processes to the sequence of rainfall and other hydrologic events.</p>	<b>3</b>
<b>10</b>	<p><b>Advanced Hydrology</b>                  Flood routing and overland flow theory. Parametric hydrology, linear and nonlinear analysis of rainfall-runoff systems, unit and instantaneous unit</p>	<b>3</b>

	hydrographs. Conceptual and digital models for the simulation of the hydrologic processes in watersheds and for runoff prediction	
11	<b>Advanced Problems in Hydromechanics and Hydraulic Engineering</b> Ideal fluid flow theorems and examples, conformal mapping, turbulence, transients, wave theory; transport processes; and other topics selected by the instructor.	3
<b>Textbook:</b>	Nazih K. Shamma, Lawrence K. Wang (2011) "Water supply and wastewater removal". John Wiley and Sons, Inc. USA.

Detailed of Theoretical And Practical Contents		
	Contents	Hours
1	<b>Hydraulics:</b> Sources and distribution of water in urban environment, including surface reservoir requirements, utilization of groundwater, and distribution systems. Analysis of sewer systems and drainage courses for the disposal of both wastewater and storm water. Pumps and lift stations. Urban planning and storm drainage practice.	4
2	<b>Water sources</b> Surface water Groundwater Quality control	4
3	<b>Water distribution works</b> Purposes of water uses	10

	Rates of water consumption Design population Predicting demand for water Fire demand Types of tanks and reservoirs Period of design Types of distribution systems Pressure zones and pressure in pipes Types of pipes Design of distribution systems Appurtenances : joints pipes, valves, water meters... Management, operation and maintenance of distribution system	
4	<b>Storm water and wastewater collection systems</b> Collection of hydrological data Precipitation Evaporation and transpiration Runoff Rainfall and runoff analysis Frequency of intense storms Intensity-duration-frequency relationships Collection of storm waters Hydraulic design Appurtenances Operation and maintenance of drainage systems	6
5	<b>Sewerage systems</b> Domestic and industrial wastes Collection of sanitary wastewater Choice of collecting system flow through sewers Design of sewers Gravity sewer pipe material Building connections Manholes Trenchless technology Appurtenances Maintenance and sewer system rehabilitation	8
6	<b>Pumps and pumping stations</b> Types of pumps Pump characteristics Pumps and their applications Pumping station types Pumping equipment Inspection and maintenance	6
7	<b>Wastewater Treatment</b> Wastewater characteristics Wastewater treatment processes Levels of wastewater treatment Reuse of wastewater	4
8	<b>Introductory Environmental Fluid Mechanics:</b> Review of governing equations for fluid flow; Nondimensionalization and scaling; boundary layer formulation and application to rivers and lakes; water waves and oscillatory flows; flow around objects, drag, and sediment transport; introduction to	4

	turbulence; effects of density stratification, including internal waves and estuaries.	
9	<b>Open Channel Hydraulics:</b> Energy and momentum principles, design of open channels for uniform and nonuniform flow, boundary layer and roughness effects, flow over spillways, energy dissipation, flow in channels of nonlinear alignment and nonprismatic section.	6

<p><b>Course description:</b> BIM (Building Information Modeling) can deliver business benefits whether the designing of sustainable houses or reimagining the infrastructure of entire cities. This management concept is based on REVIT software and enables almost anytime, anywhere access to project data throughout the building construction lifecycle. BIM concept empowers those in the field to better anticipate and act, and those in the back office to optimize and manage all aspects of construction performance. This course concerns also the preparation of the site, earth works, formwork, scaffolding, different structural elements of the construction, precast concrete, masonry works, floors and roofs, internal and external finishes, insulation and protection, shell structures using the BIM concept.</p> <p><b>Topics :</b></p> <ul style="list-style-type: none"> <li>• Building Information Modeling</li> <li>• REVIT software</li> <li>• Management concept</li> <li>• Aspects of construction performance</li> </ul> <p><b>Experiments:</b> if applicable it will support the course topics.</p> <p><b>References :</b></p> <ul style="list-style-type: none"> <li>• Roy Chudley, 5<sup>th</sup> edition, (2012) "Advanced Construction", Pearson, Prentice Hall.</li> <li>• Tony Bryan (2010), " Construction". **Course description:** This course conduct to analyse and design reinforced concrete structures like continuous beams; continuous one-way, two-way and Flat slabs. Analysing and design of stair slabs, Column under eccentrically loads, and R.C. frames, too. Applying the principles, procedures and basic theory of pre-stressed concrete in structural design.

**Topics :**

- Analysis and Design of R.C. frames.
- Design of Combined R.C. Footings.
- Analysis and Design of retaining walls.
- Principles, procedures and basic Design of Pre-stressed concrete members.
- Structural reinforced Concrete design Project (Apply computer calculation)
- Review of knowledge gained in Reinforced Concrete Structures (I)
- Analysis and design of continuous beams using moment's coefficients method, and direct design method.
- Analysis and Design of floor systems: continuous one-way, two-way, ribbed and Flat slabs.
- Design of Stair Slabs.
- Design of rectangular R.C. columns under eccentrically loads.

**Experiments:** if applicable it will support the course topics.

**Course description:** The course is concerned with the fundamentals of highway and pavement engineering. It introduces the design process of roads and intersections, including horizontal and vertical alignment design, cross-sections and earthworks. The second half of this strand deals with pavement design and evaluation. Topics include pavement composition, pavement materials, asphalt mix design, the pavement thickness design and, defects in Flexible pavements and, failures in rigid pavements.

**Topics:**

- Terminology used in the design/construction of highways and roadway pavements.
- Application of analytical Methods in the Geometric design of a highway Project
- Drainage design, soil improvement and earthwork for roadways and highways.
- Properties of pavement materials, pavement mix design and thickness for asphalt and concrete pavements.
- Pavements evaluation.

**Experiments:** If applicable, it will support the course topics.

**Course description :**

Training on Subscription software is a comprehensive project review solution that supports coordination, analysis, and communication of design intent and constructability. Multidisciplinary design data created in a broad range of Building Information Modeling (BIM), digital prototype, and process plant design applications can be combined into a single integrated project model. Interference management tools help design and construction professionals anticipate and avoid potential problems before construction begins, minimizing expensive delays and rework. Manage combines model coordination with project quantities and schedule to deliver simulation and analysis of time and cost. Entire project models can be published and freely viewed .

**Topics :**

- Navisworks Manage software.
- Integration with Autodesk BIM 360 Glue
- Bidirectional workflow between Navisworks and Glue
- Quantification
- Add quantification from an aggregated model
- Create more realistic results.
- Autodesk ReCap Point Cloud Support
- Supports more formats and access to large data sets.
- Model File and Data Aggregation

**Experiments:** if applicable it will support the course topics.

<p><b>Course description:</b> The built environment is a major source of society's environmental impact, and is a major opportunity to find solutions. Recent attention to "green construction" emerges in many domains including energy Systems, water use, construction processes, architectural design, site planning and brownfield development, just to name a few. At present, environmental issues can be considered in seemingly unlimited areas of the design and construction process. Yet, advances are slow. General perceptions assert that green construction costs too much money; that the technologies are not available for meaningful change, and opportunities are rare.</p> <p><b>Topics :</b></p> <ul style="list-style-type: none"> <li>- Ethic and Sustainability</li> <li>- Ecological design and Economics</li> <li>- Green Building Assessment</li> <li>- The green Building Design Process</li> <li>- Energy and Carbon Footprint Reduction</li> <li>- Indoor Environmental Quality</li> <li>-</li> </ul> <p><b>Experiments:</b></p> <p><b>References :</b></p> <ul style="list-style-type: none"> <li>• Kibert, C. (2005) Sustainable Construction: Green Building Design and Delivery</li> <li>• <i>Green Buildings and the Bottom Line</i> (Oak Brook, IL: Building Design + Construction). Go to: <a href="http://www.bdcnetwork.com/article/CA6390371.html">http://www.bdcnetwork.com/article/CA6390371.html</a></li> </ul>						

Detailed of Theoretical And Practical Contents		
	Contents	Hours
1	<p><b>Ethic and Sustainability:</b></p> <ul style="list-style-type: none"> <li>• Sustainable development and sustainable construction: Sustainable development requires a more extensive set of ethical principles to guide behavior because it addresses relationships between generations, calling for what is sometimes referred to as intergenerational justice.</li> <li>• Ethics between people by providing rules of conduct that are generally agreed to govern the good behavior of contemporaries.</li> </ul>	5
2	<p><b>Ecological design and Economics:</b></p> <p>Each approach seeks to acknowledge, facilitate, and/or preserve the interrelationship of natural system components and buildings. In doing so, particular questions and problems recur, such as:</p> <ul style="list-style-type: none"> <li>• What can be learned from nature and ecology that can be applied to buildings?</li> <li>• Should ecology serve as model or metaphor for green buildings?</li> <li>• How can natural systems be directly incorporated to improve the functioning of the built environment?</li> <li>• How can the human-nature interface best be managed for the benefit of both systems?</li> <li>• When does the natural system metaphor break down and is another approach required?</li> </ul>	5

3	<p><b>Green Building Assessment:</b></p> <ul style="list-style-type: none"> <li>• The most demanding of all building assessment systems is the Living Building Challenge. Its intent was to push the envelope of high-performance building much further than it was likely to be pressed by LEED and other building assessment systems.</li> <li>• The Living Building Challenge is based on a few simple but very powerful concepts, among them that a building should produce as much energy as it consumes, provide all the required water, and process all its sewage.</li> </ul>	5
4	<p><b>The green Building Design Process:</b></p> <ul style="list-style-type: none"> <li>• This chapter addresses the high-performance green building delivery system as a distinctly identifiable construction delivery system, analogous to individually recognized design-build systems.</li> <li>• A hallmark of the high-performance green building delivery system is the high level of coordination and integration required of the design and construction team members. Additional measures, such as building commissioning and the charrette, are necessary to fully implement this new delivery system.</li> <li>• Performance-based design contracts provide financial incentives to implement certain sustainable design features, such as relying on nature for some building services, thus enabling a downsizing of mechanical and electrical systems to reduce energy consumption and cost.</li> </ul>	5
5	<p><b>Energy and Carbon Footprint Reduction:</b></p> <ul style="list-style-type: none"> <li>• Perhaps of all the challenges facing the development of high-performance green buildings, significantly reducing the energy and carbon footprints of the built environment is the most daunting.</li> <li>• The environmental impacts of extracting and consuming nonrenewable energy resources such as fossil and nuclear fuels are profound. Pronounced land impacts from coal and uranium mining, acid rain, nitrous oxides, particulates, radiation, ash disposal problems, and long-term storage of nuclear waste are just some of the consequences of energy consumption by the built environment.</li> <li>• Building energy consumption in the United States is at about the same scale as energy consumption by automobiles, with about 40 percent of primary energy being consumed by buildings and about the same quantity by transportation.<sup>1</sup> In fact, much automotive energy consumption is caused by the placement of buildings on the landscape.</li> </ul>	3
6	<p><b>Indoor Environmental Quality:</b> Providing excellent indoor environmental quality (IEQ) has emerged as one of the key goals in the design of high-performance green buildings, on a par with energy efficiency and ecological system restoration.</p>	3

<p><b>Course description:</b> On completion of this element, candidates should be able to demonstrate understanding of the content through the application of knowledge to familiar and unfamiliar situations. In particular they should be able to:</p> <ul style="list-style-type: none"> <li>- Outline the scope and nature of occupational health and safety</li> <li>- Explain the moral, social and economic reasons for maintaining and promoting good standards of health and safety in building</li> <li>- Explain the role of national governments and international bodies in formulating a framework for the regulation of health and safety in building.</li> </ul> <p><b>Topics :</b></p> <ul style="list-style-type: none"> <li>- Explain the purpose of, and procedures, for health and safety auditing in building</li> <li>- Explain the purpose of, and procedures for, investigating incidents (accidents, cases of work-related ill-health and other occurrences) in building</li> <li>- Describe the legal and organizational requirements for recording and reporting incidents</li> <li>- Explain the purpose of, and procedures for, regular reviews of health and safety performance in building.</li> </ul> <p><b>Experiments:</b></p> <p><b>References :</b></p> <ul style="list-style-type: none"> <li>• <i>Syllabus summary - NEBOSH International General Certificate in Occupational Health and Safety (January 2013 specification)</i></li> <li>• <i>"Occupational Health and Safety (OH&amp;S) Management Systems, Standards and Certificates 2017"</i></li> <li>• <i>National Fire Protection Association (NFPA), 2019</i></li> </ul>								

<b>Detailed of Theoretical And Practical Contents</b>		
	<b>Contents</b>	<b>Hours</b>
<b>1</b>	<b>Sustainability concept in building:</b> Criteria such as sustainability, energy efficiency and healthfulness are considered. Green or sustainable building is the practice of creating healthier and more resource-efficient models of construction, renovation, operation, maintenance, and demolition.	<b>3</b>

2	<b>Building Management:</b> to know the hard and soft services of a built structure. To describe the management of two types of building: residential and commercial.	3
3	<b>Codes and standard in safety building:</b> - OSHA Standard - Neibosh Standard - NFPA standard	5
4	<b>Design fire-safe buildings and products:</b> Planning for fire protection in/around a building involves knowing the four sources of fire: natural, manmade, wildfire and incidental and taking an integrated systems approach that enables the designer to analyze all of the building's components as a total building fire safety system package. The analysis requires more than code compliance or meeting the minimum legal responsibilities for protecting a building; that is, building and fire codes are intended to protect against loss of life and limit fire impact on the community and do not necessarily protect the mission or assets, or solve problems brought upon by new projects with unique circumstances.	5
5	<b>Improve structure safety performance:</b> This part aims to conduct an investigation and comparison of safety performance and critical safety issues between green and conventional building construction projects, and to propose a series of feasible solutions to improve the safety performance in green building construction projects.	5
6	<b>Maintain building safeguards:</b> <ul style="list-style-type: none"> <li>• Review each Physical Safeguard standard and implementation specification listed in the Security Rule.</li> <li>• Discuss physical vulnerabilities and provide examples of physical controls that may be implemented in a covered entity's environment.</li> <li>• Provide sample questions that covered entities may want to consider when implementing the Physical Safeguards.</li> </ul>	5

<p><b>Course description:</b> The main objective is to investigate the potential use of various solid wastes for producing construction materials. To safeguard the environment, many efforts are being made for the recycling of different types of solid wastes with a view to utilizing them in the production of various construction materials. This course focuses the environmental implications caused by the generation of various solid wastes, and highlights their recycling potentials and possible use for producing construction materials.</p> <p><b>Topics :</b></p> <ul style="list-style-type: none"> <li>• Demolition construction waste management</li> <li>• Recycling construction waste management</li> <li>• Reusing construction waste management</li> <li>• Sustainable construction using wastes</li> </ul> <p><b>Experiments:</b></p> <p><b>References :</b></p> <p>Sustainable Construction Waste Management. Available from:  <a href="https://www.researchgate.net/publication/308327621_Sustainable_Construction_Waste_Management">https://www.researchgate.net/publication/308327621_Sustainable_Construction_Waste_Management</a></p>						

Detailed of Theoretical And Practical Contents		
	Contents	Hours
1	<b>Introduction</b>	4
2	<b>Demolition construction waste management:</b> Construction and demolition (C&D) materials are generated when new building and civil-engineering structures are built and when existing buildings and civil-engineering structures are renovated or demolished (including deconstruction activities). Civil-engineering structures include public works projects, such as streets and highways, bridges, utility plants, piers, and dams.	14
3	<b>Recycling construction waste management:</b> by practicing source reduction, salvaging, recycling and reusing existing materials, and buying used and recycled materials and products. The following sections provide more information about: <ul style="list-style-type: none"> <li>• How can practice source reduction by using less materials and generating less waste from your project;</li> <li>• What deconstruction means and what C&amp;D materials can salvage for reuse during deconstruction;</li> <li>• How C&amp;D materials can be recycled and how can find a recycler to recycle</li> <li>• The economic, aesthetic and environmental benefits can be achieved by buying used and recycled products</li> </ul>	12
4	<b>Reusing construction waste management:</b> Let to know the ability to reuse materials salvaged from demolition and building sites for reuse and recycling depends on:	12

	<ul style="list-style-type: none"> <li>• local recycling facilities</li> <li>• market demand</li> <li>• quality and condition of materials and components</li> <li>• time available for salvage</li> <li>• emphasis put on reuse and recycling.</li> </ul>	
5	<p><b>Sustainable construction using wastes:</b> The generation of waste in the construction industry needs to be examined by looking into the whole life cycle of a building – planning, design and procurement; construction; occupancy; operation, maintenance, renovation and demolition. In this context, managing construction waste is implemented by eliminating waste where possible, minimising waste where feasible and reusing materials which might otherwise become waste. Waste management in the construction industry should adopt the waste management hierarchy.</p>	10
