## **Program Description**

The Cybersecurity Program gives the trainee a deep understanding and practical skills in state of the art of Cybersecurity. It includes but not limited to multiple areas such as Operating Systems security, networks & communications security, Securing Software Development, and Cloud Computing & Virtualization security. The students will acquire skills to be assessed also in Digital forensics, Penetration Testing, Risk Management & Incident Response, Information Security Management, and Advanced Security Topics.

The program aims to achieve the following objectives:

- Understand the major state of the art concepts in Cyberspace security.
- Mastering the skills of securing wired and wireless networks & communications.
- Mastering the skills of building secure electronic systems and services.
- Mastering different methods of security penetration testing for systems and networks.
- Explore different technologies and applications in digital data encryption
- Increase the level of analytical capacity and investigation of incidents and digital crimes.
- Mastering risk management skills in information security departments.

**Admission Requirements:** The applicant must have a diploma in one of the following: Computer Networks, Computer Network Systems Administration, Technical Support, Computer Programming or Telecommunications.

## Brief Description

Course Name	Applied Mathematics	Course Code	MATH304	Credit Hours	4
Description	This course is designed for Cyber Security. It introduces students to basic mathematical principles and functions from discrete mathematics that form the foundation for cryptographic and cryptanalysis methods. The course covers five important themes; Mathematical reasoning and mathematical logic and Structures, algorithmic thinking, the concepts and techniques of number theory, modular arithmetic and finite fields.				

Course Name	Fundamentals of Cyber Security	Course Code	CYBR321	Credit Hours	3
Description	This course provides a basic introduction to all aspects of cyber-security including business, policy, procedures, communications security, network security, security management, legal issues, political issues, and technical issues. From the course, students will become aware of the cybersecurity aspect and gain knowledge of the related security techniques.				

Course Name	Foundation of Computer Programming	Course Code	CYBR351	Credit Hours	4
Description	The course provides the students with the required skills to write their own applications. thinking like programming is a mandatory skill that any computer related student should master; therefore the course will give students an introduction to algorithms and problem-solving skills. later in the course, students will master the basics of any programming language structure. variables, mathematical operations, conditional controlling components, looping components, arrays, functions, and basic file system operations are all skills a student will learn in this course.				

Course Name	Operating Systems Security	Course Code	CYBR312	Credit Hours	4
Description	<p>The course of OSs security encompasses many different techniques and methods, which ensure safety from threats and attacks. OSs security module includes different applications and programs to perform required tasks and stop unauthorized interference. From this course, students will learn many ways, including adherence to the following:</p> <ol style="list-style-type: none"> <li>1. Performing regular OS patch updates.</li> <li>2. Installing updated antivirus engines and software.</li> <li>3. Scrutinizing all incoming and outgoing network traffic through a firewall.</li> <li>4. Creating secure accounts with required privileges only (i.e., user management).</li> </ol>				

Course Name	Applied Cryptography	Course Code	CYBR322	Credit Hours	3
<b>Description</b>	This course is a comprehensive introduction to modern cryptography and its related standards. The course emphasis on the application and implementation of various techniques for achieving message confidentiality, integrity, authentication, and non-repudiation. Topics include: Symmetric ciphers; Classical encryption techniques; Block ciphers (DES, AES); Block cipher operation; Random bit generation; Stream ciphers; Asymmetric ciphers (RSA, Diffie-Hellman Key Exchange, Elgamal Cryptographic System, Elliptic Curve Cryptography); Cryptographic data integrity algorithms ( Cryptographic hash functions; Message authentication codes; Digital signatures). Key management and distribution.				

Course Name	Advanced Programming	Course Code	CYBR352	Credit Hours	4
<b>Description</b>	This course extends the study of basic programming principles introduced in the Foundation of Computer Programming course (CYBR351). This course covers web-development techniques in client side that use HTML5, CSS, and JavaScript as web development essentials. In addition, students will learn database basics; SQL and Server side programming.				

Course Name	Secure Software Development	Course Code	CYBR453	Credit Hours	4
<b>Description</b>	This course focuses on integrating security in the Software Development Life Cycle (SDLC). It covers the best practices that the software developer needs to avoid opening up their users, customers, and organization to attack at the application layer. In this course, students will learn how to identify and apply security controls in development environments; Assess the effectiveness of software security; Define and apply secure coding guidelines and standards.				

Course Name	Networks & Communications Security	Course Code	CYBR441	Credit Hours	4
<b>Description</b>	This course will cover theory and practice of Telecommunications and Network Security domain which encompasses topics to include: access control to computer network, weakness and security in routers and switches, transport formats and security measures used to maintain the integrity, availability, authentication and confidentiality of the transmitted information over both private and public communication networks. The different standards securities protocols will be studied, discussed and implemented AAA, IPS/IDS, VPN and PKI over Client/Server, routers, firewalls.				

Course Name	Cloud Computing & Virtualization Security	Course Code	CYBR444	Credit Hours	4
<b>Description</b>	This is an introductory course to understand the concepts of Cloud Computing, Virtualization and Computer Networks in general. From this course; students will gain an excellent understanding of basic concepts of Cloud Computing, Virtualization, and Computer Networks. This includes the definitions of CCV, cloud types and cloud service deployment models (IaaS*, PaaS*, SaaS*), learn how to create virtual machines (VM) using Hypervisors (type-2), and understand Computer Networks and IP Addressing. In Addition, students will learn how to protect data stored online from theft, leakage, deletion, and methods of providing cloud security. Also, this course includes the major threats to cloud security include data breaches, data loss, account hijacking, service traffic hijacking, insecure APIs, poor choice of cloud storage providers, and shared technology with countermeasures.				

Course Name	Penetration Testing	Course Code	CYBR 423	Credit Hours	4
<b>Description</b>	This course teaches students to learn the system and network penetration testing, the tools, techniques used to exploit vulnerabilities, and how to defend against attacks. The course covers planning, reconnaissance, scanning, exploitation, post-exploitation, and result reporting. This course will also provide the fundamental information associated with each of the methods employed and insecurities identified. In all cases, remedial techniques will be explored. From this course, students will develop an excellent understanding of issues and ways that user, administrator, and programmer errors can lead to exploitable insecurities.				

Course Name	Information Security Management	Course Code	CYBR 431	Credit Hours	3
<b>Description</b>	This course covers issues related to administration and management of the security of enterprise information systems and networks. The course includes the following topics: Planning for security and contingencies, security management models, security management practices, governance, and security policy; threat and vulnerability management, incident management, risk management, information leakage, crisis management and business continuity, legal and compliance, security awareness and security implementation considerations. The course will study the principles and tools related to these topics. The course will also cover security standards, evaluation, and certification process.				

Course Name	Advanced Technologies in Networks Security	Course Code	CYBR 442	Credit Hours	4
<b>Description</b>	This course provides students with in-depth study and practice of advanced concepts in applied systems and networking security, including security policies, access controls, authentication mechanisms, IPS, VPN, NGFW and choosing, deploying, supporting and troubleshooting all security devices. The course will discuss emerging networking techniques, inducing software-defined networking (SDN) and network function visualization (NFV). We will also discuss corresponding security issues in SDN and NFV.				

Course Name	Wireless Networks Security	Course Code	CYBR 443	Credit Hours	3
<b>Description</b>	In a mobile world, the ability to gain network access in a convenient manner, but yet securely, is becoming more and more of a requirement. This course will explore the wireless standards, authentication issues, common configuration models for commercial versus institution installs and analyze the security concerns associated with ad-hoc and standards-based methods of networking. From this course, the student will gain an understanding of wireless networking, protocols, and standards and security issues.				

Course Name	Digital Forensics	Course Code	CYBR424	Credit Hours	4
<b>Description</b>	Digital forensics involves the investigation of computer-related crimes with the goal of obtaining evidence to be presented in a court of law. In this course, you will learn the principles and techniques for digital forensics investigation and the spectrum of available computer forensics tools. In this course, students will dive into the bits and bytes to conduct computer, network, mobile and social forensic investigations; interpret e-evidence; make inferences; write defensible reports to be used in legal actions; and understand key elements of expert witness testimony. Students will use FTK (Forensic Tool Kit) along with other forensic tools to recover, search, and analyze e-evidence and create reports.				

Course Name	Risk Management & Incident Response	Course Code	CYBR432	Credit Hours	3
<b>Description</b>	This course examines information security as a risk management problem where the organization identifies information security risks, evaluates those risks, and makes risk mitigation and acceptance decisions given its resource constraints. In this course, students will learn foundational concepts in risk management and incident response and introduce to standard risk management approaches for identifying, analyzing, and responding to risk, as well as the tools and methodologies for metrics to monitor risk management activities. Students will be able to plan for and respond to intruders in an information system. They will be introduced to various types of security incidents and attacks, and learn methods to prevent detect and react to incidents and attacks.				

Course Name	Ethics and Cyber Law	Course Code	CYBR461	Credit Hours	2
<b>Description</b>	This course covers important ethics that any cyber security specialist should do and understand. In addition, Saudi cyber laws for digital crimes and Internet laws are mandatory knowledge that students should understand and comply with. Privacy and data protection and intellectual property are taught in this course.				

<b>Course Name</b>	<b>Trusted Computing</b>	<b>Course Code</b>	<b>CYBR471</b>	<b>Credit Hours</b>	<b>3</b>
<b>Description</b>	<p>This course is an introduction to the fundamental technologies behind Trusted Computing, including machine authentication, data protection, attestation, data backup, and system maintenance, etc.</p> <p>This course will also introduce students to the various software resources that exist today to support TPMs (Trusted Platform Modules) and what capabilities they can provide both at an in-depth technical level and in an enterprise context.</p> <p>Students will also learn about how other technologies such as the Dynamic Root of Trust for Measurement (DRTM) and virtualization can both take advantage of TPMs.</p>				

<b>Course Name</b>	<b>Embedded Systems Security</b>	<b>Course Code</b>	<b>CYBR472</b>	<b>Credit Hours</b>	<b>3</b>
<b>Description</b>	<p>This course covers advanced topics in the emerging technology of embedded system and internet of things developments. Designing and programming an embedded system from hardware to build an integrated application are covered in this course. Memory management, processing management, storage and file system management and transmission management in a secure fashion are all skills covered in this course.</p>				

<b>Course Name</b>	<b>Internet of Things Security</b>	<b>Course Code</b>	<b>CYBR481</b>	<b>Credit Hours</b>	<b>3</b>
<b>Description</b>	<p>IoT Security is a course designed to allow students to acquire knowledge on the fundamentals of safeguarding connected devices and networks in IoT. This course aims to introduce the concept of IoT and its impact on our daily lives, to understand the architecture and components of IoT, and to address the challenges and solutions of deploying IoT in our actual life. From this course, students will become aware of the cybersecurity issues raised by IoT and gain knowledge of the related security techniques in the design issue of the IoT.</p>				

<b>Course Name</b>	<b>Advanced Security Topics</b>	<b>Course Code</b>	<b>CYBR482</b>	<b>Credit Hours</b>	<b>3</b>
<b>Description</b>	<p>This course will cover the most recent topics in cyber security such as Blockchain, Artificial Intelligence, Machine learning, Big data, Cryptocurrency, etc. From this course, students will have an overview of the most recent cyber security topics.</p>				

## **Courses Detail Description**

<b>Department</b>	General Studies	<b>Major</b>	Cyber Security							
<b>Course Name</b>	Applied Mathematics	<b>Course Code</b>	MATH 304							
<b>Prerequisites</b>		<b>Credit Hours CRH</b>	4		CTH		6			
			L	3	P	2	T	1		
<b>CRH: Credit Hours</b>			<b>L: Lecture</b>		<b>P: Practical</b>		<b>T: Tutorial</b>		<b>CTH: Contact Hours</b>	

**Course Description:**

This course introduces students to basics of mathematical principles and functions from discrete mathematics that form the foundation for cryptographic and cryptanalysis methods. The course covers five important themes; Mathematical reasoning and mathematical logic and Structures, algorithmic thinking, the concepts and techniques of number theory, modular arithmetic and finite fields. These principles and functions will be helpful in understanding symmetric and asymmetric cryptographic methods examined in (Applied Cryptography) Course.

**Topics:**

- The Foundations of logic and Proofs
- Basics of discrete structures that include sets, permutations, relations, graphs, trees and finite state machines.
- Algorithms.
- The concepts and techniques of Number Theory.
- Finite fields.

**Experiments:**

<b>CRH: Credit Hours</b>			<b>L: Lecture</b>		<b>P: Practical</b>		<b>T: Tutorial</b>		<b>CTH: Contact Hours</b>	

**Course Description:**

This course will provide a basic introduction to all aspects of cyber-security including business, policy, procedures, communications security, network security, security management, legal issues, and technical issues. The course also covers the analytical part of the cyber security domain through which basic analytical skills can be developed for auditing and forensics of a system. From this course, students will become aware of the cybersecurity aspect and gain knowledge of the related security techniques.

**Topics:**

- Basic concepts of Cyber Security and its wider scope
- Definitions of “Threats” and “Vulnerabilities” and their consequences
- Standards in Cyber Security and their advantages
- Different categories of the system in which cyber security is critical
- Web Application’s vulnerabilities and their security countermeasures
- Mobile Application’s vulnerabilities and their security countermeasures
- Operating System vulnerabilities and their security countermeasures
- Network Security basic concepts
- Tools associated with network security

**Experiments:**

<b>Detailed of Theoretical Contents</b>		
<b>No.</b>	<b>Contents</b>	<b>Hours</b>
1	<b>Chapter 1: Introduction</b> <ul style="list-style-type: none"> <li>• Threats, vulnerabilities, and controls</li> <li>• Confidentiality, integrity, and availability</li> <li>• Attackers and attack types; method, opportunity, and motive</li> <li>• Valuing assets</li> </ul>	1
2	<b>Chapter 2: Toolbox: Authentication, Access Control, and Cryptography</b> <ul style="list-style-type: none"> <li>• Authentication, capabilities, and limitations</li> <li>• The three bases of authentication: knowledge, characteristics, possessions</li> <li>• Strength of an authentication mechanism</li> <li>• Implementation of access control</li> <li>• Employing encryption</li> <li>• Symmetric and asymmetric encryption</li> <li>• Message digests</li> <li>• Signatures and certificates</li> </ul>	2
3	<b>Chapter 3: Programs and Programming</b> <ul style="list-style-type: none"> <li>• Programming oversights: buffer overflows, off-by-one errors, incomplete mediation, Time-of-check to time-of-use errors</li> <li>• Malicious code: viruses, worms, Trojan horses</li> <li>• Developer countermeasures: program development techniques, security principles</li> <li>• Ineffective countermeasures</li> </ul>	3
4	<b>Chapter 4: The Web—User Side</b> <ul style="list-style-type: none"> <li>• Attacks against browsers</li> <li>• Attacks against and from web sites</li> <li>• Attacks seeking sensitive data</li> <li>• Attacks through email</li> </ul>	2
5	<b>Chapter 5: Operating Systems</b> <ul style="list-style-type: none"> <li>• Object protection: virtualization, sharing</li> <li>• Memory protection: registers, paging, segmentation</li> <li>• Design qualities: modularity, layering, kernelization</li> <li>• Trusted systems: TCB, reference monitor, trusted path, object reuse, evaluation criteria</li> <li>• Rootkits: power, design</li> </ul>	4
6	<b>Chapter 6: Networks</b> <ul style="list-style-type: none"> <li>• Vulnerabilities <ul style="list-style-type: none"> <li>○ Threats in networks: wiretapping, modification, addressing</li> <li>○ Wireless networks: interception, association, WEP, WPA</li> <li>○ Denial of service and distributed denial of service</li> </ul> </li> <li>• Protections <ul style="list-style-type: none"> <li>○ Cryptography for networks: SSL, IPsec, virtual private networks</li> <li>○ Firewalls</li> <li>○ Intrusion detection and protection systems</li> <li>○ Managing network security, security information, and event management</li> </ul> </li> </ul>	4

7	<b>Chapter 7: Databases</b> <ul style="list-style-type: none"> <li>• Database terms and concepts</li> <li>• Security requirements: C-I-A; reliability, types of integrity</li> <li>• Access control; sensitive data, disclosure, inference, aggregation</li> <li>• Data mining and big data</li> </ul>	4
8	<b>Chapter 8: Cloud Computing</b> <ul style="list-style-type: none"> <li>• What is a cloud service?</li> <li>• Risks to consider when choosing cloud services</li> <li>• Security tools for cloud environments</li> </ul>	4
9	<b>Chapter 9: Management and Incidents</b> <ul style="list-style-type: none"> <li>• Security planning</li> <li>• Incident response and business continuity planning</li> <li>• Risk analysis</li> <li>• Handling natural and human-caused disasters</li> </ul>	1
10	<b>Chapter 10: Legal Issues and Ethics</b> <ul style="list-style-type: none"> <li>• Protecting programs and data: copyrights, patents, trade secrets</li> <li>• Computer crime statutes and the legal process</li> <li>• Unique characteristics of digital objects</li> <li>• Software quality: Uniform Commercial Code</li> <li>• Ethics: principles and situations to explore</li> </ul>	1
<b>Textbook</b>	<ul style="list-style-type: none"> <li>• Pfleeger, C.P., Security in Computing 5<sup>th</sup> Edition.</li> <li>• Cryptography and Network Security by William Stalling, 2011</li> </ul>	

Detailed of Practical Contents		
No.	Contents	Hours
1	<p><b>Lab1: Researching Network Attacks and Security Audit Tools</b></p> <ul style="list-style-type: none"> <li>• Research network attacks that have occurred.</li> <li>• Select a network attack and develop a report.</li> <li>• Research network security audit tools.</li> <li>• Select a tool and develop a report</li> </ul>	2
2	<p><b>Lab 2: Network Monitoring</b></p> <ul style="list-style-type: none"> <li>• Experience Network Monitoring Tools (Solarwind, Wireshark, PRTG, etc.)</li> <li>• Through monitoring tools, <ul style="list-style-type: none"> <li>• learning how to track network activity,</li> <li>• viewing specific frame, TCP, IP, and HTTP information,</li> <li>• viewing specific packets being sent and received on the network,</li> <li>• viewing information within those packets and spot malicious or suspicious network behavior.</li> </ul> </li> </ul>	5
3	<p><b>Lab 3: Application Threat Analysis</b></p> <ul style="list-style-type: none"> <li>• Testing example of Web applications against threats</li> <li>• Testing example of browsers against threats</li> <li>• Testing example of Mobile applications against threats</li> </ul>	3
4	<p><b>Lab 4: Coding Practices</b></p> <ul style="list-style-type: none"> <li>• Write the code as per standard practices <ul style="list-style-type: none"> <li>○ Client-Server Application in C</li> </ul> </li> <li>• Analyze the Vulnerabilities of different languages used</li> <li>• Write the code as per standard practices <ul style="list-style-type: none"> <li>○ A webpage having a form</li> </ul> </li> <li>• Analyze the Vulnerabilities of different languages used</li> </ul>	4
5	<p><b>Lab 5: Web Threat Analysis</b></p> <ul style="list-style-type: none"> <li>• Analyze known malicious browser plugins</li> <li>• Analyze phishing techniques using Damn Vulnerable Web App (DVWA)</li> <li>• Devise Security measures against phishing</li> </ul>	3
6	<p><b>Lab 6: Databases</b></p> <ul style="list-style-type: none"> <li>• Install and run Database Server</li> <li>• Add/remove entries using a webpage</li> <li>• Practice known database attacks</li> <li>• Apply Countermeasures</li> </ul>	3
7	<p><b>Lab 7: OS Security</b></p> <ul style="list-style-type: none"> <li>• Analyze vulnerabilities of Windows and Linux</li> <li>• Explore system Firewalls</li> </ul>	3
8	<p><b>Lab 8: Network Security</b></p> <ul style="list-style-type: none"> <li>• Analyze network traffic using Wireshark</li> <li>• Practice known attacks in a network</li> <li>• Deploy system firewalls against attacks</li> <li>• Apply firewall rules</li> </ul>	3

<b>Course Description:</b> This course provides students with the required knowledge and skills to write their own applications. In this course, students will learn an introduction to algorithms and problem-solving skills. later in the course, students will master the basics of any programming language structure. variables, mathematical operations, conditional controlling components, looping components, arrays, functions and basic file system operations are all skills a student will learn in this course.								
<b>Topics:</b> <ul style="list-style-type: none"> <li>• Basics of Computing and programming</li> <li>• Discovering Input, output, and processing</li> <li>• Understanding decision structures in programming languages</li> <li>• Understanding repetition structure and its uses in programming languages</li> <li>• Understanding functions and modules concepts</li> <li>• Working with file systems</li> <li>• Working on Debugging and exception</li> <li>• Working with lists, sets, dictionaries, tuples.</li> <li>• Object-oriented programming</li> </ul>								
<b>Experiments:</b>

**Course Description:**

This course provides basic concepts of architecture and security of different Operating Systems including Windows, Linux, and Macintosh. The course of OSs security encompasses many different techniques and methods, which ensure safety from threats and attacks. OSs security module includes different applications and programs to perform required tasks and stop unauthorized interference. The course will cover security in User Registration and privileges security, File System security, User access control and Network security of the Operating Systems. A brief overview of User and Kernel Space is also included in the scope.

**Topics:**

- Basic concepts of Operating System Security and its domains
- Differences between well-known operating systems
- Standards in Operating System Security and their advantages
- The architecture of an Operating System's File system
- Processes involved in Intercommunications of different programs and processes
- User Access and User Authorization mechanisms of different Operating System
- Operating System vulnerabilities and their security countermeasures
- Network Security basic concepts
- Tools associated with network security in Operating System
- Malware injection in an Operating System and its countermeasures

**Experiments:**

**References:**

**Course Description :**

This course is a comprehensive introduction to modern cryptography and its related standards. The course emphasis on the application and implementation of various techniques for achieving message confidentiality, integrity, authentication, and non-repudiation. Topics include: Symmetric ciphers; Classical encryption techniques; Block ciphers (DES, AES); Block cipher operation; Random bit generation; Stream ciphers; Asymmetric ciphers (RSA, Diffie-Hellman Key Exchange, Elgamal Cryptographic System, Elliptic Curve Cryptography); Cryptographic data integrity algorithms (Cryptographic hash functions; Message authentication codes; Digital signatures). Key management and distribution

**Topics :**

- Introduction to Cryptography & Network Security
- Symmetric Ciphers
- Asymmetric Ciphers
- Cryptographic Data Integrity Algorithms
- Key Management and Distribution

**Experiments:**

**Course Description:**

The course covers the theory and practice of network and communication security, focusing in particular on the security aspects of the network. The different weakness in routers, switches, and transmission channel will be represented. The different security protocols will be studied, discussed and implemented AAA, IPS/IDS, VPN, MPLS, SET, and PKI over routers or firewalls.

**Topics :**

Upon successful completion of this course, students will be able to:

- Identify the fundamental concepts of network and communication security.
- Identify security threats and vulnerabilities.
- Identify and implement access control and account management security measures.
- IDS/IPS
- Configure Firewalls and UTM
- Configure SET
- Kerberos
- Switch security
- Configure VPN layer 2 and 3 with different protocols

**Experiments:**

- Routers
- Switches
- Firewall

**Course Description :**

This course provides an in-depth review of the theoretical and applied topics in network security. Students satisfactorily completing the course will be able to formulate a security model for network environments, and apply cryptography, protocol design, and emergent network security technologies to meet the requirements of that model. The course considers research and solutions in a broad selection of important network. In studying these environments, we consider important works in protocol design and formal analysis, advanced authentication, network configuration and management, firewalls systems, intrusion detection, and other topics.

**Topics :**

- Cisco ASA firewalls, Cisco ASA NGFW,
- Securing network using Cisco Routers and Cisco catalyst switches,
- Create DMVPN, FlexVPN,
- Implement Central Web Authentication (CWA),
- Describe trust solution,
- Design a highly secure wireless solution
- Implement Cisco Cloud Web Security (CWS)
- Implement Cisco Web Security Appliance (WSA)
- Implement Cisco Email Security Appliance
- Implement Cisco Next-Generation Firewall (NGFW) Security
- Implement Cisco Advanced Malware Protection (AMP)
- Implement architectures (public cloud, private cloud)
- Design a web security solution
- Implement Cisco FirePOWER Next-Generation IPS (NGIPS)

**Experiments:**

- Routers
- Switches
- Firewall NG

**References :**

**CCNP Security:**

- Implementing Cisco Secure Access Solutions (SISAS)
- Implementing Cisco Edge Network Security Solutions (SENS)
- Implementing Cisco Secure Mobility Solutions (SIMOS)
- Implementing Cisco Threat Control Solutions (SITCS)

**Course Description:**

In a mobile world, the ability to gain network access in a convenient manner, but yet securely, is becoming more and more of a requirement. This course covers the basics of networking, wired networks, wireless networks, the architecture of wireless networks, security challenges in wireless networks and technology used for security of wireless networks. This course also will explore the wireless standards, authentication issues, common configuration models for commercial versus institution installs and analyze the security concerns associated with ad-hoc and standards-based methods of networking. The course also gives insight into the basics of large scale networks, their applications and security standards. From this course, the student will gain an understanding of wireless networking, protocols, and standards and security issues.

**Topics:**

- Basic concepts of Wireless Networking
- Difference between Wireless and Wired Networks
- Pros and Cons of Wireless Networks
- The architecture of Wireless Networks
- Design and Planning of Wireless Networks
- Security challenges to a wireless network
- Tools and Techniques to enhance security
- Mobile architecture
- Operating systems in Mobile
- Mobile hacking and security

**Experiments:**

<b>Course Description:</b> This is an introductory course to understand the concepts of Cloud Computing, Virtualization and Computer Networks in general. From this course; students will gain an excellent understanding of basic concepts of Cloud Computing, Virtualization, and Computer Networks. This includes the definitions of CCV, cloud types and cloud service deployment models (IaaS, PaaS, SaaS), learn how to create virtual machines (VM) using Hypervisors (type-2), and understand Computer Networks and IP Addressing. A brief overview of the security of a Cloud System and its forensics are also included in the contents of the course.								
<b>Topics:</b> <ul style="list-style-type: none"> <li>• Understanding Basic Concepts of Cloud Computing</li> <li>• Understanding Cloud Computing Threats</li> <li>• Understanding Cloud Computing Attacks</li> <li>• Understanding Cloud Computing Security</li> <li>• Understanding Cloud Security Tools</li> <li>• Understanding Cloud Penetration Testing</li> <li>• Understanding Cloud Security Standards and Features</li> <li>• Understanding Cloud Auditing and Performance Monitoring</li> <li>• Understanding Cloud Forensics concept and parameters</li> </ul>								
<b>Experiments:</b>								
<b>References:</b> <ul style="list-style-type: none"> <li>• Barrie Sosinsky. 2011. Cloud Computing Bible (1st ed.). Wiley Publishing.</li> <li>• Research papers and related publications</li> </ul>

**Course Description:**

This course was designed to provide students with the tools and techniques used by hackers and information security professionals. This course will immerse students into the Hacker Mindset so that they will be able to defend against future attacks.

Students will be thought the Five phases of Ethical Hacking and thought how the student can approach your target and succeed at breaking in every time! The five phases include Reconnaissance, Gaining Access, Enumeration, Maintaining Access, and covering your tracks. The tools and techniques in each of these five phases are provided in detail in an encyclopedic approach to help you identify when an attack has been used against your own targets.

**Topics :**

- Understand the different phase of hacking:
- Footprinting and Reconnaissance
- Scanning Networks
- Enumeration
- Vulnerability Analysis
- System Hacking
- Malware Threats
- Sniffing
- Denial-of-Service
- Session Hijacking
- Social Engineering
- ...

**Experiments:**

- Linux and Windows server
- VMware
- Software tools for different techniques.

**References:**

- CEHV9-10 theoretical and practice/ECCouncil

**Course Description:**

This course covers issues related to administration and management of the security of enterprise information systems and networks. The course includes the following topics: Planning for security, security management models, security management practices, governance, and security policy; threat and vulnerability management, information leakage, crisis management and business continuity, legal and compliance, security awareness and security implementation considerations. The course will study the principles and tools related to these topics. The course will also cover security standards, evaluation, and certification process.

**Topics:**

- Introduction to Management of Information Security.
- Governance and Strategic Planning for Security.
- Information Security Policy.
- Developing the Security Program.
- Security Management Models
- Security Management Practices
- Personnel And Security

**Experiments:**

**References:**

- Management of Information Security, 5th Edition by Michael E. Whitman; Herbert J. Mattord
- **Splunk Enterprise Overview:**

<b>Department</b>	Engineering of Computer and Information Technology	<b>Major</b>	Cyber Security							
<b>Course Name</b>	<b>Digital Forensics</b>	<b>Course Code</b>	<b>CYBR424</b>							
<b>Prerequisites</b>	CYBR423 and CYBR444	<b>Credit Hours CRH</b>	4		<b>CTH</b>		6			
			<b>L</b>	2	<b>P</b>	4	<b>T</b>	0		
<b>CRH: Credit Hours</b>			<b>L: Lecture</b>		<b>P: Practical</b>		<b>T: Tutorial</b>		<b>CTH: Contact Hours</b>	

**Course Description:**

In this course, students will dive into the bits and bytes to conduct computer, mobile and social forensic investigations; interpret evidence; make inferences; write defensible reports to be used in legal actions; and understand key elements of expert witness testimony. Students will use FTK (Forensic Tool Kit) along with other forensic tools to recover, search, and analyze e-evidence and create reports

**Topics:**

- Overview of digital investigation and digital evidence
- Data Acquisition of physical storage devices
- Study of file systems with the main focus on Microsoft Windows & Linux Systems
- File System Analysis & file recovery
- File carving & document analysis
- Information hiding & steganography
- Network forensics
- Mobile forensics
- Cloud forensics

**Experiments:**

Digital forensics tools

**References:**

Detailed of Practical Contents		
Chapter.	Contents	Hours
1	<p><b>Lab: Building a computer forensics lab:</b></p> <p>Create a forensically sound duplicate of the evidence (forensic image) that ensures the original evidence is not unintentionally modified, to use for data recovery and analysis processes. This includes HDD, SSD, CD/DVD, PDA, mobile phones, GPS, and all tape formats</p>	3
2	<p><b>Lab: Linux Forensics</b></p> <ul style="list-style-type: none"> <li>• Collect Volatile and Non-Volatile Information</li> <li>• Use Various Shell Commands</li> <li>• Examine Linux Log files</li> </ul>	3
3	<p><b>Lab: Windows Forensic Tools:</b></p> <ul style="list-style-type: none"> <li>• Helix3 Pro, X-Ways Forensics,</li> <li>• Windows Forensic Toolchest (WFT),</li> <li>• Autopsy, The Sleuth Kit (TSK),</li> </ul>	3
4	<p><b>Lab: Data Acquisition Software Tools:</b></p> <p>Perform data acquisition (using UltraKit, Active Disk Image, DriveSpy, etc.)</p>	3
5	<p><b>Lab: Tools to defeat Anti-Forensics:</b> <i>(The instructor can choose a lab according to the tools available and time)</i></p> <ul style="list-style-type: none"> <li>• Use File Recovery Tools (Recover My Files, EaseUS Data Recovery Wizard, etc.), Partition Recovery Tools ( Active Partition Recovery, 7-Data Partition Recovery, Acronis Disk Director Suite, etc.), Rainbow Tables Generating Tools (rtgen, Winrtgen), Windows Admin Password Resetting Tools (Active Password Changer, Windows Password Recovery Bootdisk, etc.).</li> <li>• Understand the usage of Application Password Cracking Tools (Passware Kit Forensic, SmartKey Password Recovery Bundle Standard, etc.), Steganography Detection Tools (Gargoyle Investigator™ Forensic Pro, StegSecret, etc.)</li> </ul>	5
6	<p><b>Lab: Network Forensics Tools:</b> <i>(The instructor can choose a lab according to the tools available and time)</i></p> <ul style="list-style-type: none"> <li>• Use network monitoring tools to capture real-time traffic spawned by any running malicious code after identifying intrusion via dynamic analysis</li> <li>• Understand the working of wireless forensic tools (NetStumbler, NetSurveyor, Vistumbler, WirelessMon, Kismet, OmniPeek, CommView for Wi-Fi, WiFi USB Dongle: AirPcap, tcpdump, KisMAC, Aircrack-ng Suite AirMagnet WiFi Analyzer, MiniStumbler, WiFiFoFum, NetworkManager, KWiFiManager, Aironet Wireless LAN</li> </ul>	5
7	<p><b>Lab: Web Security Tools, Firewalls, Log Viewers, and Web Attack Investigation Tools:</b> <i>(The instructor can choose a lab according to the tools available and time)</i></p>	5

	Understand the working of web Security Tools, Firewalls, Log Viewers, and Web Attack Investigation Tools (Acunetix Web Vulnerability Scanner, Falcove Web Vulnerability Scanner, Netsparker, N-Stalker Web Application Security Scanner, Sandcat, Wikto, WebWatchBot, OWASP ZAP, dotDefender, IBM AppScan, ServerDefender, Deep Log Analyzer, WebLog Expert, etc.)	
8	<p><b>Lab: Malware Forensics Tools:</b> <i>(The instructor can choose a lab according to the tools available and time)</i></p> <p>Use Malware Analysis Tools (VirusTotal, Autoruns for Windows, RegScanner, MJ Registry Watcher, etc.)</p>	7
9	<p><b>Lab: Email Forensics Tools:</b> <i>(The instructor can choose a lab according to the tools available and time)</i></p> <p>Use email forensic tools (Stellar Phoenix Deleted Email Recovery, Recover My Email, Outlook Express Recovery, Zmeil, Quick Recovery for MS Outlook, Email Detective, Email Trace - Email Tracking, R-Mail, FINALeMAIL, eMailTrackerPro, Paraben's email Examiner, Network Email Examiner by Paraben, DiskInternal's Outlook Express Repair, Abuse.Net, MailDetective Tool, etc.)</p>	7
10	<p><b>Lab: Mobile Forensics Software and Hardware Tools:</b> <i>(The instructor can choose a lab according to the tools available and time)</i></p> <p>Use mobile forensic software tools (Oxygen Forensic Suite, MOBILedit! Forensic, BitPim, SIM Analyzer, SIMCon, SIM Card Data Recovery, Memory Card Data Recovery, Device Seizure, Oxygen Phone Manager II, etc.)</p>	7
11	<p><b>Lab: Cloud Forensics Tools:</b> <i>(The instructor can choose a lab according to the tools available and time)</i></p> <p>Use Cloud Forensics Tools (UFED Cloud Analyzer, WhatChanged Portable, WebBrowserPassView, etc.)</p>	4
Textbook	<ul style="list-style-type: none"> <li>✓ <b>Hands-on Incident Response and Digital Forensics, Mike Sheward 2018</b></li> <li>✓ <b>Digital Forensics and Investigations, People, Process, and Technologies to Defend the Enterprise, by Jason Sachowski, 2018.</b></li> <li>✓ <b>Digital Forensics with Kali Linux, Perform data acquisition, digital investigation, and threat analysis using Kali Linux tools, by Shiva V.N. <b>Course Name</b>	<b>Risk Management &amp; Incident Response</b>	<b>Course Code</b>	<b>CYBR 432</b>			
<b>Prerequisites</b>	CYBR431	<b>Credit Hours CRH</b>	3		<b>CTH</b>	4
			<b>L</b>	2	<b>P</b>	2

**CRH: Credit Hours    L: Lecture    P: Practical    T: Tutorial    CTH: Contact Hours**

**Course Description :**

This course examines information security as a risk management problem where the organization identifies information security risks, evaluates those risks, and makes risk mitigation and acceptance decisions given its resource constraints. In addition, students will learn the concepts and practices of contingency operations, including the administration of the planning process for incident response, disaster recovery, and business continuity planning. Topics include organizational readiness planning, the phases of incident response, different contingency strategies, tasks related to the preparation, implementation, operations, and maintenance of disaster recovery,

**Topics :**

- Risk Management: Identifying And Assessing Risk.
- Risk Management: Controlling Risk
- Planning for Contingencies
- Incident Response
- Disaster Recovery
- Business Continuity

**Experiments:**

**References :**

Detailed of Practical Contents		
Chapter.	Contents	Hours
1	<b>LAB1: Identifying And Assessing Risk (tools for automating risk assessment)</b> Exercise 1-6 [Management of Information Security (chapter6)]	2
2	<b>LAB2: Controlling Risk (Calculate the SLE, ARO, ALE for threats cases)</b> Exercise 1-7 [Management of Information Security (chapter7)]	2
3	<b>LAB3: Planning for Organizational Readiness:</b> In this lab, we will set up a virtual system running Security Onion, an open source intrusion detection, and network monitoring application. We will use Security Onion in future Hands-On Projects, so it's important to get it set up and running now.	2
4	<b>LAB4: Contingency Strategies for IR/DR/BC</b> In this lab, we will examine two different ways to make a backup of the Security Onion virtual image we already created. In the first method, we will make a backup from within Security Onion, using command- line tools. In the second method, we will copy the virtual image files themselves.	2
5	<b>LAB5: Incident Response: Planning</b> In this lab, students will use Security Onion to examine a simulated attack on a network. This exercise will help students understand the basics of how to determine if an attack is taking place, as well as how to get information about the attack so that appropriate action can be taken. Students will use the SQueRT tool in Security Onion to help you analyze data in a meaningful way as well as to examine packets in both individual and session contexts, giving them a deeper understanding of the overall scope of the attack.	2
6	<b>LAB6: Incident Response: Detection and Decision Making</b> In this lab, students will use the Sguil application in Security Onion to examine another attack on a network. This project will help them understand what was done during an attack by viewing the captured network traffic in a complete session.	2
7	<b>LAB7: Incident Response: Organizing and Preparing the CSIRT</b> In this lab, students will use Security Onion to examine how an incident can be evaluated to determine where it came from, what malicious software (malware) was downloaded, and what server the malware came from. To do this, students will use the Wireshark application as well as the NetworkMiner application. In this exercise, a user has clicked on a URL in an e-mail, which triggered the malware download.	2
9	<b>LAB8: Incident Response: Response Strategies</b> In this lab, students will use the Xplico application that's included in the Security Onion distro to examine a pcap file. Xplico is frequently used to	3

Detailed of Practical Contents		
Chapter.	Contents	Hours
	enable incident responders to do post-incident forensics work, but it can also be used to examine traffic in real time. Students will simulate an examination of network traffic captured during an incident, looking at the various types of traffic captured in order to determine what the attacker did while on your network.	
9	<b>LAB9: Incident Response: Recovery and Maintenance</b> In this lab, students will take a look at chaosreader, a Perl script that is incorporated in the Security Onion distro. Chaosreader is designed to read pcap files and return information on sessions as well as replay some of them. In this lab, students will simulate an examination of network traffic captured during an investigation of suspicious employee activity in order to determine what activities the employee was engaged in while on the network.	3
10	<b>LAB10: Disaster Recovery: Preparation and Implementation</b> In this lab, we will take a look at Ostinato, an open source packet generator that is incorporated in the Security Onion distro. Ostinato can generate packets of different types and has the added benefit of a user-friendly GUI, as opposed to working strictly from the command line. This lab will walk students through the process of creating a stream of packets using Ostinato, then examining that traffic in Wireshark.	3
11	<b>LAB11: Disaster Recovery: Operation and Maintenance</b> In this lab, we will take a look at reassembler, a Python script that reassembles fragmented packets in multiple methods so that analysts can view questionable traffic exactly as an IDS saw it, thus helping them determine whether the IDS made a proper decision regarding the traffic in question. Additionally, we will use reassembler to write the traffic to disk, so that binary payloads can be examined in the same form that the potential target operating system would view it.	3

**Course Description:**

This course is an introduction to the fundamental technologies behind Trusted Computing, including machine authentication, data protection, attestation, data backup, and system maintenance, etc. The course will also introduce students to the various software resources that exist today to support TPMs (Trusted Platform Modules) and what capabilities they can provide both at an in-depth technical level and in an enterprise context.

Students will also learn about how other technologies such as the Dynamic Root of Trust for Measurement (DRTM) and virtualization can both take advantage of TPMs

The course provides in-depth knowledge on trust computing in networks

1. To learn the concepts of trust categories
2. To understand trust architecture and formalization of security properties
3. To learn trusted computing and administration

**Topics:**

- Be able to explain critically the notion of trust as embodied in trusted computing devices, and the requirements upon those devices;
- Know the role and purpose of each element of the trusted platform module;
- Be able to use the Trusted Software Stack API to interact with the TPM;
- Understand how technologies of virtualization can combine with trusted platform modules to yield trusted infrastructure;
- Describe some systems architectures which use these capabilities to provide innovative and strong security solutions.

**Experiments:**

### Course Description :

The course Study of various security models and techniques for embedded systems both from a hardware as well as a software perspective. Smart card security. RFID attack models (including power analysis, side channel, and timing attacks), and security techniques. Security in wireless sensor networks (key management techniques, attack models, detection and prevention techniques). eHealth (embedded medical systems) security. Cryptographic hardware. Industrial control systems (SCADA). Physical hardware. Security for System-on-chip, and Internet-devices such as Internet thermostats and automated doors.

### Topics :

At the end of the unit student will be able to understand:

- ✓ What are embedded software characteristics,
- ✓ implementation and security application of embedded systems.
- ✓ Architecture for embedded systems security
- ✓ Implementing hardware and software security in Embedded systems.

### Experiments:

- FPGA Programmer
- EPROM Programmer
- Microcontroller

### References :

- ✓ Embedded Systems Security, Practical Methods for Safe and Secure Software and Systems Development; David Kleidermacher Mike Kleidermacher 2012.
- ✓ Hands-On Embedded System Design, Leverage the power of ARM Processors, FPGAs, ASIPs and ASICs for building effective embedded system design 2018.

**Course Description:**

“Internet of Things” (IoT) is an emerging technology that is changing our world with its innovative products such as “smart homes”, “consumer wearables”, and “autonomous vehicles”. This course aims to introduce the concept of IoT and its impact on our daily lives, to understand the architecture and components of IoT, and to address the challenges and solutions of deploying IoT in reality. Students will learn how to make design trade-offs between communication and computation costs and between hardware and software. In addition, cybersecurity is a critical design issue of the IoT system. From this course, students will become aware of the cybersecurity issues raised by IoT and gain knowledge of the related security techniques. Students will also gain hands-on experiences in building IoT devices and implementing security techniques through team projects.

**Topics:**

Students successfully completing this course will:

- Understand the impact of IoT technologies
- Be able to draw the big picture of the IoT ecosystem
- Be able to identify the architecture of IoT systems
- Be able to describe the essential components of IoT
- Have the knowledge of the emerging technologies of IoT
- Be able to examine the security and privacy challenges of IoT
- Be able to find appropriate security/privacy solutions for IoT
- Have hands-on experience in IoT and security projects.

**Experiments:**

Raspberry PI  
Arduino

**Course Description:**

The trainee should choose a topic that reflects the knowledge and skills he learned throughout the program study. It is recommended that each student does his own project. The project-based learning method should be conducted in this course.

**Topics:**

- Week 1-2: Forming the team, selecting a project topic, and studying the final report format.
- Week 3: project proposal approval by the advisor.
- Week 4: Project plan due.
- Week 5-8: Start building/implementing the project and advisor feedback.
- Week 9: Progress report and presentation and advisor feedback.
- Week 10-13: Building project continue and start writing the final report.
- Week 14: Testing or/and Debugging or/and Troubleshooting.
- Week 15: Distributing the final report to the testing committee.
- Week 16: The final report and presentation in front of the committee.

**Experiments:**

1	CYBR 312	Operating Systems Security	Master/PH.D. in Information Security related fields <b>Or</b> IT related + ( <a href="#">GCWN</a> or <a href="#">GCUX</a> or equivalent)
2	CYBR 321	Fundamentals of Cyber Security	Master/PH.D. in Information Security related fields <b>or</b> IT related +( <a href="#">GSEC</a> or equivalent)
3	CYBR 322	Applied Cryptography	Master/PH.D. in Information Security related fields <b>Or</b> IT related + ( <a href="#">ECES</a> or <a href="#">CECP</a> or equivalent)
4	CYBR 351	Foundation of Computer Programming	Master/PH.D. in Computer Science or IT Related fields
5	CYBR 352	Advanced Programming	Master/PH.D. in Computer Science or IT Related fields
6	CYBR 453	Secure Software Development	Master/PH.D. in Computer Science + ( <a href="#">CSSLP</a> or <a href="#">GSSP</a> or equivalent)
7	CYBR 441	Networks & Communications Security	Master/PH.D. in Information Security related fields <b>Or</b> Networking related fields + ( <a href="#">CND</a> or equivalent)
8	CYBR 442	Advanced Technologies in Networks Security	Master/PH.D. in Information Security related fields <b>or</b> IT related + ( <a href="#">GNEA</a> or [ <a href="#">EC-council CAST 614</a> ] or CCNP Security Specialization or equivalent)
9	CYBR 443	Wireless Networks Security	Master/PH.D. in Information Security related fields <b>or</b> IT related + ( <a href="#">GAWN</a> or <a href="#">OSWP</a> or <a href="#">CWSP</a> equivalent)
10	CYBR 444	Cloud Computing & Virtualization Security	Master/PH.D. in Information Security related fields <b>or</b> IT related +( <a href="#">CCSP</a> or <a href="#">CCSS</a> or <a href="#">CCSK</a> or equivalent)

11	CYBR 423	Penetration Testing	Master/PH.D. in Information Security related fields <b>Or</b> IT related + ( <a href="#">GPEN</a> or <a href="#">LPT</a> or <a href="#">OSCP</a> or equivalent)
12	CYBR 424	Digital Forensics	Master/PH.D. in Information Security related fields <b>or</b> IT related + ( <a href="#">GCFE</a> or <a href="#">GCFA</a> or <a href="#">CCFE</a> or <a href="#">CHFI</a> or equivalent)
13	CYBR 431	Information Security Management	Master/PH.D. in Information Security related fields <b>or</b> IT related + <a href="#">CISSP</a> or <a href="#">CISM</a> or <a href="#">GISP</a> or <a href="#">CICISO</a> or <a href="#">CISA</a> or equivalent
14	CYBR 432	Risk Management & Incident Response	Master/PH.D. in Information Security related fields <b>or</b> IT related + ( <a href="#">GCIH</a> or <a href="#">CGEIT</a> or <a href="#">CRISC</a> or equivalent)
15	CYBR 461	Ethics and Cyber Law	Master/PH.D. in any IT related fields
16	CYBR 471	Trusted Computing	Master/PH.D. in Information Security related fields
17	CYBR 472	Embedded Systems Security	Master/PH.D. in Information Security related fields <b>Or</b> Computer Engineering
18	CYBR 481	Internet of Things Security	Master/PH.D. in Information Security related fields
19	CYBR 482	Advanced Security Topics	Master/PH.D. in Information Security related fields <b>Or</b> Any Curriculum courses instructor qualifications'
20	CYBR 491	Graduation Project	Master/PH.D. in Information Security related fields <b>Or</b> Any Curriculum courses instructor qualifications'
21	MATH304	Applied Mathematics	Master or PH.D. in Applied Mathematics only
22	INET 313	Computer Networks	Master or PH.D. in Networking Technologies related fields.
23	INSA 312	Basic Networks Systems Administration	Master or PH.D. in Network Technologies related fields.
24	INSA 444	Open Source Network Systems	Master or PH.D. in Network Technologies related fields.
